Quarterly Monitoring Report, First Quarter 2014

76 (Former BP) Service Station No. 11147
690 Ygnacio Valley Rd, Walnut Creek, California
San Francisco Bay Regional Water Quality Control Board

1.0 INTRODUCTION

Antea®Group has prepared this *Quarterly Monitoring Report, First Quarter 2014* for 76 (Former BP) Service Station No. 11147 in Walnut Creek, California (**Figure 1**) to summarize the analytical data obtained from the most recent groundwater monitoring and sampling event completed on February 6, 2014. Please refer to **Figure 2** for the site layout and to **Appendix A** for additional site location information and for the history of the environmental investigations and remedial actions.

1.1 Work Performed in the First Quarter 2014

1. Antea Group submitted the *Quarterly Monitoring Report, Fourth Quarter 2013*, dated January 27, 2014, to the San Francisco Bay Regional Water Quality Control Board (SFBRWQCB).
2. Antea Group's subcontractor Blaine Tech Services, Inc. (Blaine Tech) conducted the first quarter 2014 groundwater monitoring and sampling event on February 6, 2014.

1.2 Work Proposed for the Second Quarter 2014

1. Antea Group will submit the *Quarterly Monitoring Report, First Quarter 2014* (contained herein) to the SFBRWQCB.
2. Antea Group will sample on-site soil vapor wells, including new wells SV-3S/D, in April depending on weather.
3. Blaine Tech will conduct the second quarter 2014 groundwater monitoring event.

2.0 CURRENT PROJECT STATUS

Current phase of project:	Quarterly groundwater monitoring
Current monitoring well gauging schedule*:	Quarterly: MW-2R, MW-3R, MW-7 and MW-8; VW-1 through VW-7
Current monitoring well sampling schedule:	Quarterly: MW-2R, MW-3R and MW-8 Annually (1st Quarter): MW-7
Local receptors:	As of the October 2010 *Sensitive Receptor Survey*, there are no known wells within ½ mile of the site. There are as many as 7 sensitive receptor businesses located within 2,500 feet of the site (see **Appendix A**).
Current remediation technique	No active remediation (dormant SVE and air sparge systems)

2.1 Regulatory Correspondence

Antea Group did not exchange correspondence with the SFBRWQCB during the first quarter 2014.

2.2 Groundwater Monitoring

For the first quarter 2014 groundwater monitoring and sampling event, Blaine Tech gauged eleven wells and purged/sampled four wells per their standard sampling protocol. **Appendix B** includes copies of Blaine Tech's field data sheets, and the following table presents a summary of the recent gauging and sampling process.

Well gauging and sampling date:	February 6, 2014
Wells gauged:	MW-2R, MW-3R, MW-7 and MW-8; VW-1 through VW-7 **(Table 1)**
Wells sampled:	MW-2R, MW-3R, MW-7, and MW-8
Purge method:	3 well casing volumes via electric submersible pump
Sample collection method:	Disposable bailers
Groundwater parameters measured (**Appendix B**):	Temperature, pH, Conductivity, Oxidation-reduction potential (ORP), Turbidity, Dissolved Oxygen (DO)
Wells with measurable LNAPL:	None

2.2.1 Groundwater Flow Gradient and Directional Trends

Using the gauging data collected on February 6, 2014, Antea Group calculated the groundwater elevation in each well from surveyed well casings (**Tables 1** and **2**). **Figure 3** shows an overall groundwater flow direction to the northeast at a gradient of 0.002 feet per foot (ft/ft), which is generally consistent with historical groundwater flow and gradient trends.

2.2.2 Groundwater Quality Data

Blaine Tech submitted groundwater samples collected during this sample event under chain-of-custody protocol to Kiff Analytical, LLC. (Kiff), a National Environmental Laboratory Accreditation Program (NELAP) certified laboratory (Certification No. 08263CA). The analytical report is included in **Appendix C**. Groundwater samples were analyzed for the following contaminants of concern:

- Gasoline Range Organics (GRO; referred to as total petroleum hydrocarbons as gasoline (TPH-gas) in the laboratory analytical report), benzene, toluene, ethylbenzene, total xylenes (BTEX compounds), and methyl tertiary-butyl ether (MTBE) by Environmental Protection Agency Method 8260B.

Groundwater analytical results are presented in **Table 2** (current) and **Tables 3** and **3a** (historical). Historical geochemical data are presented in **Table 4** for reference and a brief discussion is included in **Appendix A**.

The laboratory reported the following ranges of contaminant concentrations in the groundwater samples collected during this sample event (the table below lists only the reported contaminants):

Constituents (ESL in µg/L)	Number of Reported Samples Above LRL of the Samples Collected	Minimum Reported Concentration, in µg/L (Sample ID)	Maximum Reported Concentration, in µg/L (Sample ID)
GRO (100)	2 of 4	450 (MW-3R)	5,000 (MW-2R)
Benzene (1.0)	1 of 4	<0.50	4.3 (MW-2R)
Ethylbenzene (30)	1 of 4	<0.50	250 (MW-2R)
Total Xylenes (20)	1 of 4	<0.50	120 (MW-2R)
MTBE (5.0)	1 of 4	<0.50	3.6 (MW-2R)

Explanations:
ESL = Regional Water Quality Control Board, San Francisco Bay Region, Environmental Screening Level where groundwater is a potential or current drinking water source
µg/L = Micrograms per liter
LRL = Laboratory Reporting Limit

2.2.3 Groundwater Contaminant Trends

Well MW-2R reported the maximum contaminant concentrations during this first quarter sampling event, as shown in the table above. The dissolved-phase GRO plume is centered on the northern end of the underground storage tanks, as indicated by contaminant concentrations in MW-2R (**Figure 4**). Concentrations of benzene, ethylbenzene, and MTBE were only reported in MW-2R during this sampling event (**Figure 5**), while toluene was not found above the LRL in any of the sampled wells.

Appendix D includes graphs depicting GRO, benzene and MTBE concentrations and groundwater elevations over time for wells MW-2/2R and MW-3/3R. Analytical data from replacement wells MW-2R and MW-3R is presented with historical data from MW-2 and MW-3 on the same time series graph for comparison. Contaminant concentrations at MW-2R continue to decrease from the previous sampling events.

2.2.4 Waste Disposal Summary

Blaine Tech generated approximately 31 gallons of wastewater from well purging/sampling and equipment cleaning during the recent sampling event. Blaine Tech transported the wastewater to their bulk facility in San Jose, California, and after the batching process, the wastewater will be transported to Seaport Environmental in Redwood City, California for disposal. The waste manifest for the first quarter is not yet available, and will be included in the next monitoring report.

2.2.5 Quality Assurance / Quality Control (QA/QC)

Antea Group's QA/QC measures included use of a trip blank and a detailed QA/QC data validation check on the Kiff analytical results for this sampling event. Our laboratory data validation checklist and the Kiff laboratory report are included in **Appendix C**.

Trip Blank (TB1_20140228):	No contaminants reported
Laboratory QA/QC Performed:	Yes (validated by Antea Group)
Laboratory Data Qualifiers:	None noted
Are the data valid for their intended purpose?	Yes, the data are valid

Kiff did not note any qualifiers in the laboratory analytical report for samples submitted during this first quarter 2014 event. Based on a review of the laboratory's analytical reports, including Kiff's QA/QC procedures and those implemented by Antea Group, we conclude that the laboratory data obtained are valid for their intended purpose.

3.0 CLOSING

- Antea Group continued quarterly groundwater monitoring with a February 2014 sampling event at four of the site monitoring wells.
- In general, the first quarter 2014 groundwater contaminant concentrations at well MW-2R are similar to those last reported in MW-2. GRO was the only contaminant reported at MW-3R during the first quarter 2014 sampling event.
- Antea Group and Blaine Tech will continue quarterly groundwater monitoring activities at the site with the next scheduled event to occur in May 2014.

4.0 REMARKS

The recommendations contained in this report represent Antea USA, Inc.'s professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This report is based upon a specific scope of work requested by the client. The contract between Antea USA, Inc. and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea USA, Inc.'s client and anyone else specifically identified in writing by Antea USA, Inc. as a user of this report. Antea USA, Inc. will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea USA, Inc. makes no express or implied warranty as to the contents of this report.

Gauging Notes:
TOC - Top of Casing
ft - Feet
NP - LNAPL not present
LNAPL - Light non-aqueous phase liquid
* - Corrected for LNAPL if present (assumes LNAPL specific gravity = 0.75)
DRY - Well is dry
-- - No information available
TB - Trip Blank

Analytical Notes:
< - Not detected at or above indicated laboratory reporting limit
ug/L - micrograms/liter
GRO- gasoline range organics
MTBE- Methyl tertiary-butyl ether

	11/8/2013	143.79	dry	dry	dry	--	--	--	--	--	--	--	--	--	--	--	--	--

Gauging Notes:
TOC - Top of Casing
ft - Feet
NP - LNAPL not present
LNAPL - Light non-aqueous phase liquid
* - Corrected for LNAPL if present (assumes LNAPL specific gravity = 0.75)
NG - Not gauged
WI - Well Inaccessable
NSVD - Not surveyed
DRY - Well is dry
-- - No information available

Analytical Notes:
-- - No information available
< - Not detected at or above indicated laboratory reporting limit
DRY - Well was Dry; sample could not be taken
LPH - Liquid Phase Hydrocarbons
NS - Well not sampled.
ug/L - micrograms/liter
WI - Well Inaccessable
GRO- gasoline range organics
MTBE- Methyl tertiary-butyl ether
TBA- Tertiary-butyl alcohol
DIPE- Di-isopropyl ether
ETBE- Ethyl tertiary-butyl ether
TAME- Tertiary-amyl methyl ether
1n - Carryover was confirmed by a second analysis performed out of hold with non-detect result; result may be biased high due to carryover from previously analyzed sample.

Analytical Notes:

-- - No information available, sample not collected

< - Not detected at or above indicated laboratory reporting limit

* Data from field measurements collected through a flow cell while purging three casing volumes using a submersible pump.

mV - millivolts

mg/L - milligrams per liter

µg/L - micrograms/liter

(µS/cm) - microsiemens per centimeter

NTU - nephelometric turbidity unit

ORP - Oxidation-Reduction Potential

DO - Dissolved Oxygen

Appendix A

Summary of Previous Environmental Investigations and Remedial Actions

SUMMARY OF PREVIOUS ENVIRONMENTAL INVESTIGATIONS AND REMEDIAL ACTIONS

Reported subsurface environmental investigations at 76 (Former BP) Service Station No.11147 date back to 1987 and periodic monitoring to 1992, with active remediation conducted between December 2003 and October 2005 via soil vapor extraction and air sparge system. A summary of the reported previous investigations and remediation work follows.

In **July 1987**, four underground storage tanks (USTs) – a 6,000-gallon, 8,000-gallon, and 10,000-gallon gasoline tank and one, 550-gallon waste oil tank – were removed. The tanks were reportedly in good condition. A limited amount of soil was reportedly excavated from the tank cavities at the time of the tank removal. Soil samples were subsequently collected from approximately two feet below each tank. No contaminants were reported at concentrations greater than the laboratory reporting limits.

In **October 1992**, an initial subsurface assessment was conducted at the site. Four soil borings (B-1 through B-4) were drilled to total depths of 45.5 feet (ft) below ground surface (bgs). Borings B-2, B-3, and B-4 were completed as monitoring wells MW-1, MW-2, and MW-3, respectively. Total petroleum hydrocarbons as gasoline (TPH-g) and benzene, toluene, ethylbenzene and total xylenes (BTEX) were detected in the soil samples collected from boring B-3 (MW-2) at depths of 20.5 and 24.5 ft bgs. In MW-2 and MW-3, light non-aqueous phase liquid (LNAPL) was observed at thicknesses of up to 1.95 feet. In MW-1, TPH-g and BTEX were reported at concentrations of 180 and 5 micrograms per liter (µg/L), respectively, but no LNAPL was present.

In **June 1993**, four additional monitoring wells (MW-4 through MW-7) and one recovery well (RW-1) were installed to depths ranging 30 to 40 ft bgs as part of a supplemental site investigation. No TPH-g was detected in soil samples collected from these new wells. Adsorbed-phase BTEX compounds were detected in soil samples collected at 20.5 ft bgs and 30.5 ft bgs in boring RW-1.

Between **1992 and 1994**, approximately 20.69 gallons of LNAPL were removed from wells MW-2, MW-3, and RW-1.

In 1994, a remedial investigation and feasibility study (RI/FS) was performed for the site to further characterize the site and evaluate remedial alternatives. The RI/FS consisted of installing air sparge (AS) well SP-1 to a total depth of 42 ft bgs and conducting aquifer pumping, air sparging, and soil vapor extraction (SVE) pilot testing. An AS test was conducted on April 20, 1994 using well SP-1 as the injection point and wells MW-3 and RW-1 as observation points. Injection rates of up to 3.8 standard cubic feet per minute (scfm) and pressure up to 11 pounds per square inch (psi) were applied to SP-1. The test indicated an estimated radius of influence of 30 ft.

In **July 1994**, two SVE tests were conducted using wells RW-1 and MW-3. Various vapor extraction rates (up to 73 cubic feet per minute) and vacuum pressures (up to 105 inches of water) were applied separately to RW-1 and then MW-3, while observations on the influence in the opposite well were noted. Based on the pilot test results, the SVE radius of influence was estimated to be approximately 25 ft, and SVE and AS were determined to be viable remedial alternatives for the site.

In **May 1998**, the product dispenser lines were replaced. During the replacement activities, soil samples were collected beneath four product dispensers (PD-NE, PD-NW, PD-SW and PD-SE) and beneath product lines (PL-1 through PL-4). TPH-g, BTEX and MTBE were detected in soil sample PD-SE at 3.5 ft bgs at concentrations of 890 mg/kg, 12 mg/kg, 59 mg/kg,

22 mg/kg, 130 mg/kg and 61 mg/kg. The soil sample collected at 5 ft bgs did not yield any hydrocarbons with the exception of MTBE at 4.4 mg/kg. Xylenes were detected in sol sample PD-SW at concentrations of0.033 mg/kg, and MTBE was detected in soil samples PL-1 and PL-3 at concentrations of 0.090 mg/kg and 0.14 mg/kg, respectively.

In **April 2002**, sparge points SP-2 through SP-5 and monitoring well MW-8 were installed on the site. The sparge points and new monitoring well were installed to depths of up to 45 ft bgs. Low concentrations (up to 1.0 milligrams per kilogram [mg/kg]) of TPH-g were reported in soil samples collected and analyzed from the borings for SP-2 and SP-3. Toluene and methyl-tert-butyl ether (MTBE) were reported at concentrations of 0.062 and 0.13 mg/kg, respectively, in the sample collected from SP-2 at 25 to 25.5 ft bgs. Also in **April 2002**, seven vapor extraction wells (VW-1 to VW -7) were installed. Because of the close proximity of these borings to the air sparging points, no soil samples were retained for analysis. In **August 2002**, the additional sparge point, monitoring wells and soil vapor extraction wells were surveyed.

In **December 2003**, an AS and SVE remediation system was installed. The SVE system utilized the seven vapor extraction wells (VW-1 through VW-7), which were connected by means of subsurface piping to an aboveground SVE system. Vacuum was applied to the wells by means of a 25 horsepower (hp) regenerative thermal oxidizer (RETOX) that was mounted on a mobile trailer unit. The trailer mounted RETOX also consisted of a silica bed for heat recovery and a 50-gallon knockout pot along with a transfer pump. The air sparging system consisted of a rotary screw compressor conveying air to AS wells SP-1 through SP-5 via subsurface piping.

The remediation system was shut down for repairs on **October 20, 2005**, and it has remained down since that time. During its last three months of operation, the SVE system did not contain any detectable influent concentrations of TPH-g, benzene, or MTBE above laboratory reporting limits. Toluene was detected at concentrations ranging from 0.68 to 0.84 milligrams per cubic meter (mg/m3) and xylenes were detected at concentrations ranging from 0.97 to 2.10 mg/m3. Despite the reduced recovery in its last months of operation, the system reportedly extracted a calculated estimate of 3,266 lbs of TPH-g, 352 lbs of benzene, and 10 lbs of MTBE.

On **February 15, 2008**, SECOR submitted a draft public notification fact sheet and mailing list to the Regional Water Quality Control Board (RWQCB) as required by a regulatory directive dated December 28, 2007.

On **April 24, 2009**, Delta Consultants (Delta), assumed the lead consultant position. Since that time, quarterly groundwater monitoring has continued via the gauging of all wells and sampling of five monitoring wells (MW-1, MW-2, MW-3, RW-1, and MW-8), plus four additional wells (MW-4 through MW-7) sampled annually.

In **October 2010**, Delta submitted an *Investigation Work Plan* to further investigate soil and groundwater on and downgradient of the site, as well as potential soil vapor next to the site's building. RWQCB approved that work plan, and in **January/February 2011,** Antea Group (formerly Delta) installed one additional monitoring well (MW-9), two soil vapor monitoring wells (SV-1 and SV-2), and four soil borings (B-5, B-6, B-7, and B-10). In addition to soil samples, Antea Group collected a groundwater grab sample from boring B-5. Results from this investigation showed no soil vapor impacts in shallow (5-foot and 10-foot) samples, and very little impact (low levels of MTBE only) in downgradient, off-site well MW-9. In addition, Antea Group collected soil samples, and the on-site impacts were shown to be limited to soils at or below the groundwater table in the immediate vicinity of the UST complex near the center of the site. Antea Group

recommended a full year of quarterly monitoring following the installation of downgradient well MW-9, before re-evaluating the path forward based on the groundwater contaminant trending and plume stability in late 2011.

In **November 2012**, Antea Group submitted a Well Abandonment and Replacement Report which summarized the abandonment of six wells (MW-1, MW-3, MW-4, MW-5, MW-6 and MW-9) and one recovery well (RW-1). In addition, the report summarized the installation of replacement well MW-3R. From which, Antea Group retained soil samples for laboratory analysis from the upper four feet (4 feet bgs), near the estimated depth of the nearby tank pit (16.0 feet bgs), at the groundwater-soil interface (31.5 feet bgs) and at the highest PID interval (39.0 feet bgs). The laboratory did not report any analytes above the laboratory reporting limits (LRLs) in any of the soil samples collected from MW-3R.

On **May 3, 2013**, Antea Group submitted a *Soil Vapor Investigation and Well Replacement Work Plan* to the RWQCB. In this Work Plan, Antea Group proposes to destroy and replace MW-2 with MW-2R, as well as advance and install two soil vapor wells nested together (SV-3 S/D).

Antea Group completed the work outlined in the Work Plan in **August 2013**. Antea Group retained shallow soil samples at MW-2R and SVE-3S/D for characterization purposes, as well as soil at depths of 29.5 feet and 31 feet bgs in MW-2R to evaluate secondary source material just above and below the soil-groundwater interface. Laboratory analytical results indicate reportable concentrations of diesel range organics (DRO), total petroleum hydrocarbons – motor oil (TPH-MO), and a minor concentration of naphthalene in soil analyzed during this investigation. The DRO, TPH-MO, and naphthalene results were all below the respective San Francisco Bay-RWQCB Environmental Screening Levels (ESLs), with the exception of DRO at 4.5 feet bgs in MW-2R. On **December 5, 2013**, Antea Group submitted a *Monitoring Well Replacement and Soil Vapor Well Installation Report* to the RWQCB, detailing the August 2013 field activities.

SENSITIVE RECEPTORS

In **October 2010**, Delta submitted a *Sensitive Receptor Survey* consisting of an EDR records review, a well radius search, a site reconnaissance, and a web-based search for sensitive receptors which have the potential to be affected by the petroleum hydrocarbon release at the site. The results indicate that all of the identified sensitive receptors and wells within a 0.5-mile radius at the site do not appear to be affected by the soil, soil vapor, and/or groundwater impact due to the release at the site.

GEOCHEMICAL ANALYSES

Beginning third quarter 2011, Antea Group requested the laboratory analyze groundwater samples for certain geochemical and physical parameters that indicate groundwater quality and the general occurrence of natural attenuation processes. The third quarter 2012 marked the fifth consecutive quarterly monitoring for these parameters.

Dissolved oxygen (DO) measurements indicate whether conditions in groundwater are aerobic or anaerobic. DO readings under approximately 2 milligrams per liter (mg/L) indicate anaerobic conditions, and over 2 mg/L indicate aerobic conditions (ITRC 2002). DO concentrations are predominantly below 2 mg/L in site wells, indicating that conditions beneath the site are primarily anaerobic (reducing), especially in the core of the plume around the USTs.

Methane is produced under reducing conditions by microbial degradation using carbon dioxide as an electron receptor. Methanogenesis is most likely to occur in the plume core due to the abundance of organic carbon (ITRC 2002). Wells MW-2, MW-3 and RW-1 near the USTs reported the highest concentrations of methane, indicating methanogenesis may be occurring in the plume core.

Under slightly reducing conditions, nitrate can act as an electron acceptor during biodegradation, hence reduced nitrate levels with respect to background levels are anticipated during nitrate depletion (ITRC 2002). Nitrate levels in the upgradient and cross-gradient wells (MW-1, MW-4, MW-5, MW-6 and MW-8) and in downgradient well MW-7 are greater than 1,000 micrograms per liter (µg/L); nitrate concentrations in downgradient well MW-9 are greater than 100 µg/L but less than 1,000 µg/L and concentrations in wells MW-2, MW-3 and RW-1 are low (<100 µg/L) to non-detect. The nitrate results indicate that nitrate depletion may also be occurring within the contaminant plume.

Microbes utilize sulfate as a terminal electron acceptor in the process of hydrocarbon biodegradation in groundwater in anaerobic conditions. Soluble or dissolved ferrous (Fe2+) iron occurs when oxidized ferric iron (Fe3+) is reduced under anaerobic conditions. The result is that microbes utilize sulfate to consume hydrocarbons, and in the process convert ferric iron to ferrous iron, causing a depletion of sulfate and hydrocarbons, and an increase in ferrous iron (Stempvoort et al., 2001). Relatively low sulfate concentrations in wells MW-2, RW-1 and MW-9, and consistent ferric iron concentrations in wells MW-2, MW-3 and RW-1 as compared to other site wells suggest some ferric iron reduction may be occurring near and downgradient of the USTs.

Manganese (+4) is reduced to soluble manganese (+2) during microbial degradation (Wisconsin DNR). Manganese concentrations are highest in wells MW-3 and RW-1, which suggests manganese reduction is occurring in this area beneath the site.

In general, concentrations of electron acceptors (nitrate and sulfate) are lower and reaction end products (ferrous iron, methane and manganese) are higher at the center of the dissolved phase plume than at the outer edges indicating bioattenuation is likely occurring beneath the site.

Certified Laboratory Analytical Report and Data Validation Form

KIFF Analytical LLC

Report Number : 87348
Date : 02/13/2014

Laboratory Results

Douglas Umland
Antea Group
1155 North 1st Street, Suite 201
San Jose, CA 95112

Subject : 5 Water Samples
Project Name : 2611147
Project Number :

Dear Mr. Umland,

Chemical analysis of the samples referenced above has been completed. Summaries of the data are contained on the following pages. Sample(s) were received under documented chain-of-custody. US EPA protocols for sample storage and preservation were followed. Testing procedures comply with the 2003 NELAC and TNI 2009 standards. Laboratory results relate only to the samples tested. This report may be freely reproduced in full, but may only be reproduced in part with the express permission of Kiff Analytical, LLC. Kiff Analytical, LLC is certified by the State of California under the Environmental Laboratory Accreditation Program (ELAP), lab # 08263CA.
If you have any questions regarding procedures or results, please call me at 530-297-4800.

Sincerely,

Troy G. Turpen

Quarterly Monitoring Report - First Quarter 2014

Union Pacific Railroad
2 Fourth Street and 34 Sixth Street, Santa Rosa, California
North Coast Regional Water Quality Control Board
Case No. 1TSR196

1.0 INTRODUCTION

On behalf of Union Pacific Railroad (UPRR), Antea®Group has prepared this *Quarterly Monitoring Report – First Quarter 2014* for the referenced site located at 2 Fourth Street and 34 Sixth Street in Santa Rosa, California (**Figure 1**). The site is currently owned by Sonoma Marin Area Rail Transit (SMART) and is used as an equipment and supply storage area for SMART construction activities taking place off site. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the "3 West Third Street and 60 West Sixth Street Warehouses", to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties (**Figure 2**). For a summary of the site's background and a history of previous environmental investigations that have been conducted at the subject site, refer to **Appendix A**.

The current well network consists of four groundwater monitoring wells (MW-1 through MW-4) that were installed at the site in May 2013. This report summarizes the data obtained from the first quarter 2014 groundwater monitoring event completed on February 27, 2014. Included herein are groundwater flow contours and trends, contaminant concentration maps, and historical data tables. This report has received a technical review by Ms. Lia Holden, California Professional Geologist #8584.

1.1 Work Performed in the First Quarter 2014

1. Antea Group submitted the *Quarterly Monitoring Report – Fourth Quarter 2013* to the North Coast Regional Water Quality Control Board (NCRWQCB) on January 16, 2014.
2. Antea Group's subcontractor Blaine Tech Services, Inc. (Blaine Tech) conducted quarterly groundwater gauging and sampling activities on February 27, 2014.

1.2 Work Proposed for the Second Quarter 2014

1. Antea Group will submit the *Quarterly Monitoring Report – First Quarter 2014* to the NCRWQCB (contained herein).
2. Antea Group will prepare a report requesting environmental case closure.

2.0 CURRENT PROJECT STATUS

Current phase of project:	Quarterly Groundwater Monitoring
Lead agency for cleanup oversight:	North Coast Regional Water Quality Control Board (Case No. 1TSR196)
Monitoring well gauging and sampling schedule:	Quarterly: MW-1, MW-2, MW-3, and MW-4
Total number of monitoring wells (**Table 1**):	Onsite: 4 wells (MW-1, MW-2, MW-3, MW-4)
Range of well depths (total depth below ground surface, bgs):	18.5 to 20.0 feet bgs
Historical depth to water range, in feet below top of casing (BTOC):	Min: 7.78 (MW-4, 2/27/14) Max: 15.53 (MW-1, 11/20/13)
Historical groundwater elevation range (ft):	Min: 136.33 (MW-1, 11/20/13) Max: 144.19 (MW-4, 2/27/14)

2.1 Regulatory Correspondence

No correspondence was exchanged during the first quarter 2014.

2.2 Groundwater Monitoring

For this groundwater monitoring event, all four onsite monitoring wells were gauged, purged, and sampled by subcontractor Blaine Tech per standard sampling protocol (**Appendix B**). Copies of Blaine Tech's field data sheets are included in **Appendix C**. The recent gauging and sampling data are summarized below.

Well gauging and sampling date:	February 27, 2014
Wells gauged and sampled:	MW-1, MW-2, MW-3 and MW-4
Purge method:	Peristaltic pump
Sample collection method:	Dedicated equipment (tubing)
Groundwater parameters measured (**Appendix C; Table 2**):	Depth to water, temperature, pH, conductivity, oxidation-reduction potential (ORP), turbidity, and dissolved oxygen (DO)
Current depth to water range of wells (ft BTOC):	Min: 7.78 (MW-4) Max: 10.95 (MW-3)
Current groundwater elevation range of wells (ft):	Min: 142.36 (MW-1) Max: 144.19 (MW-4)
Groundwater flow direction and gradient:	West-northwest with a hydraulic gradient of 0.012 feet/foot

2.2.1 Groundwater Flow Gradient and Directional Trends

Using the well gauging data from February 27, 2014 and the surveyed well casing elevations (**Table 1**), Antea Group calculated the groundwater table elevation at each monitoring well location (**Table 3**). These elevations were used to calculate and plot the groundwater flow direction and gradient across the site (**Figure 3**).

Based on the first quarter 2014 data, the groundwater flow direction at the site is to the west-northwest with a general hydraulic gradient of 0.012 feet/foot. The groundwater flow during the first quarter 2014 is similar to the

three previous sampling events, but there appears to be localized variation in the groundwater elevation in the eastern portion of the site. In historic reports, groundwater elevation contours prepared with the site's former (larger) well network showed somewhat variable localized flow patterns across the site with an overall flow toward the west-southwest, which is more directly toward Santa Rosa Creek. **Appendix D** includes flow and gradient data from both monitoring events tabulated and plotted on a rose diagram.

2.2.2 Groundwater Quality Data and Contaminant Trends

Groundwater samples collected during the first quarter 2014 sampling event were submitted under chain of custody protocol to TestAmerica Laboratories, Inc. (TestAmerica), a state of California certified laboratory (California Certification No. 2496). The submitted groundwater samples were analyzed for the following:

- Diesel range organics (DRO) by Environmental Protection Agency (EPA) Method 8015 with and without silica gel cleanup,
- Motor oil range organics (MORO) by EPA Method 8015 with and without silica gel cleanup, and
- Polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270C SIM.

The complete laboratory analytical report is included in **Appendix E**. Groundwater analytical results are presented in **Table 3** (current) and **Table 4** (historical); a groundwater concentration map is presented as **Figure 4**.

The laboratory reported three detections above the laboratory reporting limit (LRL). DRO was detected in monitoring wells MW-1 and MW-4 without silica gel cleanup at concentrations of 56 micrograms per liter (µg/L) and 57 µg/L, respectively. MORO was detected in monitoring well MW-4 at a concentration of 110 µg/L. DRO and MORO with silica gel cleanup were not reported above the LRL in any of the wells, indicating that the DRO and MORO detections may be attributed to heavily weathered residual hydrocarbons or naturally occurring carbon from organic material decomposition. PAHs were not detected above the LRL in any of the groundwater samples during the first quarter 2014 event.

2.2.3 Waste Disposal Summary

Well purge water generated during the first quarter 2014 sampling event was contained in a single Department of Transportation (DOT) approved 55-gallon drum and was temporarily stored at the site. Antea Group is currently coordinating drum pickup and removal with subcontractor United Pumping Services Antea Group will include the fully executed manifest in the next quarterly monitoring report.

2.2.4 Quality Assurance / Quality Control (QA/QC)

QA/QC measures included use of a field duplicate sample and a detailed QA/QC data validation check on the TestAmerica laboratory analytical results for the February 2014 sampling event performed by Conestoga-Rovers and Associates (CRA). The TestAmerica laboratory report and CRA validation memo is included as **Appendix E**. A summary of QA/QC information follows.

Duplicate (WG-2344-DUP1-20140227) collected at parent sample MW-4:	Contaminant concentrations were not detected above the LRL for both the parent and duplicate sample (See validation memo in **Appendix E**)
Laboratory QA/QC Performed:	Yes (memo provided by CRA)
Laboratory Data Qualifiers:	No data qualifiers were indicated in the laboratory report
Are the data valid for their intended purpose?	Yes, the data are valid

After review of the laboratory validation provided by CRA, Antea Group concludes that the laboratory data obtained during this groundwater sampling event are valid for their intended purpose.

3.0 CONCLUSIONS AND RECOMMENDATIONS

All site monitoring wells were sampled during the first quarter 2014 monitoring event. The only detections in groundwater were DRO without silica gel cleanup in monitoring wells MW-1 and MW-4, and MORO without silica gel cleanup in MW-4 only. Groundwater samples were also analyzed using silica gel cleanup, and MORO and DRO were below the respective laboratory reporting limits. An evaluation of current analytical data indicates minimal weathered hydrocarbon impact in groundwater; site conditions are comparable to those known at the time of the site's 2007 case closure.

One year of groundwater monitoring was proposed for the site. The first quarter 2014 sampling event marks the fourth consecutive sampling event. Conditions at the site continue to remain stable and consistent with those at the time of the previous case closure. Antea Group will prepare a request for case closure during the second quarter 2014. Antea Group requests to discontinue groundwater monitoring during closure request preparation and while the NCRWQCB reviews the request for environmental case closure.

4.0 LIMITATIONS

The findings contained in this report represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. For any reports cited that were not generated by Antea USA, Inc., the data from those reports are used "as is" and is assumed to be accurate. Antea USA, Inc. does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. This report is based upon a specific scope of work requested by the client. The Contract between Antea Group and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea Group's Client and anyone else specifically listed on this report. Antea Group will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea Group makes no express or implied warranty as to the contents of this report.

Appendix A

Site Details and Summary of Previous Environmental Investigations

SITE DETAILS

Currently, the site is being used as a construction equipment supply storage area for Sonoma Marin Area Rail Transit (SMART) construction activities taking place off site. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the 3 West Third Street and 60 West Sixth Street Warehouses, to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties.

There are currently four groundwater monitoring wells (MW-1 through MW-4) at the site; quarterly groundwater sampling and monitoring is underway.

PREVIOUS INVESTIGATION AND SITE HISTORY SUMMARY

Over the history of environmental activities at the site, laboratories and consultants have used a wide variety of terms for petroleum hydrocarbons reported in analysis of soil and water. Soil and groundwater samples are analyzed typically by Environmental Protection Agency (EPA) method 8015B or 8260B. Antea Group uses the designation GRO for total petroleum hydrocarbons as gasoline within the C_5 to C_{10} carbon range, DRO for total petroleum hydrocarbons as diesel within the C_{10} to C_{28} carbon range, and RRO for total petroleum hydrocarbons as residual range organics (oil) within the C_{24} to C_{40} carbon range.

Terms from previous reports may include total recoverable petroleum hydrocarbons (TRPH), total purgeable petroleum hydrocarbons (TPPH) for GRO, total extractable petroleum hydrocarbons (TEPH) for DRO, and total volatile hydrocarbon (TVH) which refers to a broad carbon range. More specific historical terms are total petroleum hydrocarbons as gasoline (TPHg or TPH-G), total petroleum hydrocarbons as diesel (TPHd or TPH-D), and total petroleum hydrocarbons as oil or motor oil (TPHo, TPHmo, TPH-O, or TPH-MO). The designations are generally comparable to GRO, DRO, and RRO. Antea Group has left the original designation when summarizing historic data and the current designations when applied to recent investigations and summary discussions.

SITE HISTORY

In December 1987, Canonie Environmental Services Corporation (Canonie) removed three USTs from the site. These included a 230-gallon fuel oil UST, a 10,000-gallon diesel UST, and a 10,000-gallon gasoline UST, which were located within and northwest of the existing fenced enclosure. During UST removal activities, no holes or signs of leakage or overfilling were noted for any of the tanks. TPH were not detected above laboratory reporting limits in the soil samples collected from beneath the USTs (Industrial Compliance [IC], 1992).

In April 1990, the North Coast Regional Water Quality Control Board (RWQCB) drilled four borings in the western portion of the property and installed monitoring wells in two of the borings (MW-2 and MW-3). Monitoring well MW-3 was located approximately 100 feet down gradient (to the southwest) of the former fuel oil UST. Based on

information presented in a July 1992 report by IC, analytical results for samples collected from the RWQCB borings showed that no petroleum hydrocarbons were present in soil samples collected from soil boring B-1. However, oil and grease was present in the soil sample collected from boring B-1 at 12 feet bgs at a concentration of 200 milligrams per kilogram (mg/kg). Additionally, this sample contained low concentrations of polynuclear aromatic hydrocarbons (PAHs). Soil samples collected at depths of 6 and 16 feet below ground surface (bgs) from soil boring MW-3 contained petroleum hydrocarbons quantified as diesel (TPHd) at concentrations of 11 and 30 mg/kg, respectively. No petroleum hydrocarbons were detected in the groundwater sample collected by the RWQCB from monitoring well MW-2; TPHd was detected at a concentration of 0.4 milligrams per liter (mg/l) in the groundwater sample collected at monitoring well MW-3 (Geomatrix Consultants, Inc. [Geomatrix], 2000).

Soil and grab groundwater samples were collected from five borings located near the former UST area by IC in 1992. No detectable concentrations of petroleum hydrocarbons, benzene, toluene, ethylbenzene, or xylenes (BTEX compounds), or PAHs were reported in any of the soil samples collected. Grab groundwater samples collected from the location of the former diesel and gasoline USTs did not contain petroleum hydrocarbons or BTEX above laboratory reporting limits. The grab groundwater sample collected from the former fuel oil tank location reportedly contained TPHd at concentrations of 31 mg/l; no gasoline or BTEX compounds were detected in the grab groundwater sample collected from IC-B6 (Geomatrix, 2000).

The RWQCB destroyed monitoring wells MW-2 and MW-3 in June 1995. In November 1996, Geomatrix performed an investigation of soil and groundwater at the site to evaluate potential significant environmental impacts resulting from historical features or features identified during previous investigations and to respond to a request by the RWQCB to perform additional characterization in the vicinity of the former underground fuel oil tank. Twelve borings (SRB20 through SRB31) were drilled and samples were analyzed for TPHd, total petroleum hydrocarbons quantified as motor oil (TPHmo), PAHs, metals, and volatile organic compounds (VOCs). Soil samples collected for analyses of TPHd, PAHs, and metals were composited vertically from each boring; discrete samples subsequently were analyzed if elevated concentrations of constituents were detected. Only discrete samples were analyzed for VOCs. Petroleum hydrocarbons were detected in soil at elevated concentrations in boring SRB20 and SRB21, however the presence of petroleum hydrocarbons at these locations decreased with depth. Specifically, the shallower composite sample from SRB20 contained TPHmo at a concentration of 900 mg/kg. Discrete samples from depths of 4.0 and 6.5 feet contained TPHmo at concentrations of 69 mg/kg and less than 5 mg/kg, respectively. No TPHd was detected in soil samples from boring SRB20. In SRB21, TPHmo was present at a concentration of 510 mg/kg in the shallow composite sample; no TPHmo was detected in deeper, discrete samples from this boring. Shallow composite and deeper discrete soil samples from boring SRB21 contained TPHd, at a maximum concentration of 1,600 mg/kg. The concentration of TPHd in this boring decreased with depth and was not detected in the sample collected from 13.5 feet bgs (Geomatrix, 2000).

PAHs were detected in soil at concentrations below 1996 EPA screening criteria for industrial exposure. Concentrations of PAHs detected at this time are also below current PRGs (USEPA, 1999). For example, the maximum detected concentration of benzo(a)pyrene was 0.026 mg/kg in the discrete sample collected from a

depth of 12.5 feet bgs in boring SRB22; the current PRG for benzo(a)pyrene is 0.29 mg/kg. The highest PAH concentration detected was in the discrete soil sample collected from a depth of 7 feet bgs in boring SRB22. In this sample, flourene was detected at a concentration of 0.87 mg/kg; the PRG for flourene is 33,000 mg/kg. Metals concentrations in soil were within expected background concentrations and less than 10 times the soluble threshold limit concentration (STLC)4 in all of the soil samples (discrete and composite). Concentrations of metals in soil samples also were below industrial PRGs. No TPHd, TPHmo, or VOCs were detected in groundwater above laboratory reporting limits. The results of the 1996 sampling program indicated no significant environmental issues at the site. However, based on its review of the results of the November 1996 work, the RWQCB requested that additional issues be addressed before case closure would be considered. These items, which are the focus of the work described herein, include additional evaluation of historical features, potential leachability of petroleum hydrocarbons, and groundwater quality at various site locations (Geomatrix, 2000).

In September 2001, five on-site and off-site groundwater monitoring wells were installed to characterize impacts to groundwater at the project site. A majority of wells were installed in the area of the aforementioned Santa Rosa Woolen Mills facility in the northwest portion of the project site. An up-gradient, single-screen monitoring well was installed on the eastern portion of the property in vicinity of the main line railroad tracks.

Extensive investigative activities were performed in 2002 on the northwest area of the project site at the historical location of the Santa Rosa Woolen Mills Facility. Soil samples collected as part of an investigation within this area reported significant concentrations of petroleum hydrocarbons present in soil and groundwater in the area of the fueling structures, the area of the former above ground fuel storage tank (AST), and the location of a former UST. Impacts to soil were identified as being primarily heavy range petroleum hydrocarbons. From June 2002 to November 2002, an additional characterization was performed in the northwestern area and a fenced enclosure at the property. Soil samples collected from these areas indicated significant concentrations of diesel and motor oil in soil. Proposed remedial options included excavation and removal of accessible impacted soil (EBA, 2008b).

In October and November 2003, approximately 6,500 cubic yards of impacted soil were removed from several areas of the project site. The most significant remediation efforts targeted the northwestern portion of the project site where several areas were excavated to remove impacted soil. Source removal activities began in the area of a former wooden UST that is indicated on historic Sanborn maps for the Santa Rosa Woolen Mills facility. During the excavation activities, remnants of the former UST were found and removed, whereupon the excavation was advanced to a total depth of approximately 18 feet bgs. A significant amount of free-phase petroleum hydrocarbon product was encountered on the groundwater surface during the excavation activities. The product and water was subsequently pumped, treated, and disposed of to the sanitary sewer. The excavation in this area, which resulted in the removal of approximately 700 cubic yards of impacted materials, proceeded to within 20 feet of the existing Sixth Street Warehouse and was subsequently terminated due to concerns of structure stability. Confirmation soil samples indicated that impacted materials containing significant concentrations of diesel and motor oil remained in place in the excavation sidewalls and groundwater in this area (EBA, 2008b).

Excavation activities in the northwestern portion of the property also included the removal off a fuel pipeline. The associated trench was enlarged as it encountered impacted materials in an area designated as the main pit excavation area. A total of 350 cubic yards of impacted materials were removed from this area. The excavation pit extended to depths below first encountered groundwater, which was encountered at approximately 19 feet bgs. The maximum depth attained by the excavation was approximately 22 feet bgs. Impacted groundwater encountered within the excavation pit, which included free-phase petroleum hydrocarbon product, was subsequently removed using pumps, treated, and disposed of to the sanitary sewer (EBA, 2008b).

Additional excavation was also performed on the south side of the aforementioned product line trench in the northwestern area. Approximately 325 cubic yards of impacted soil was removed from this area. Approximately 270 cubic yards of impacted soil was excavated and removed in the southwestern side of the project site identified as the "southern warehouse area" (EBA, 2008b).

Quarterly groundwater monitoring performed in the northwestern portion of the project site property and west into the neighboring property parcel indicated low levels of petroleum hydrocarbons in a monitoring well identified as SRMW-13 located in the northwest corner of the property. In addition, the fuel oxygenate methyl tert-butyl ether (MTBE) was detected in SRMW-8 located on the northeast side of the property. The remaining monitoring wells appear to have been relatively free of impacts during the time monitored (EBA, 2008b).

The RWQCB issued a *No Further Action* (NFA) letter for the previous case at the site on August 31, 2007. In 2008, Sonoma Marin Area Rail Transit District (SMART) granted an option to purchase the site, formerly owned by Northwestern Pacific Railroad Authority (NWRPA) to New Railroad Square Associates, LLC for transit-oriented development purposes. In anticipation of property ownership for the site, New Railroad Square Associates, LLC (with consent from SMART) contracted the services of EBA Engineering (EBA) to perform environmental assessment activities. EBA's November 2008 *Comprehensive Report on Findings* concluded that on-site hazardous materials presently exist at various locations on the property. These materials include an underground oil storage tank (UST), heavy hydrocarbon soil and groundwater impacts in the vicinity of soil boring SB-1, and impacted shallow soil across the site. The RWQCB reopened the environmental case for the site on January 16, 2009 based on EBA's findings.

In a letter dated February 4, 2011, the RWQCB directed UPRR to remove the oil UST on the property due to SMARTs site improvement activities planned for the site. Another letter, dated July 22, 2011, was submitted to UPRR from the RWQCB which directed them to remove "known shallow impacts", soil impacts encountered during property development and removal of impacted soil in the vicinity of SB-1 in addition to the removal of the oil UST. In November 2011, United Pumping Services (UPS) removed the UST as directed. However, during the initial day-lighting activities of the oil UST, an additional 500-gallon UST containing oil was discovered adjacent and west of the known tank. UPS evacuated, cleaned and removed the second UST in conjunction with the known UST. UPS

excavated and disposed of approximately 213.03 tons of impacted soil surrounding the USTs, and pumped approximately 500 gallons of oil impacted groundwater from the excavation. Antea Group collected 16 soil samples and one grab groundwater sample from within the excavation. Based on the distribution of MORO, DRO, VOCs, and PAHs, it appears that a release from the removed USTs only affected the immediate soils surrounding the USTs. Sidewall samples NWB and SWB collected at 15 feet bgs reported concentrations of VOCs and PAHs not found in any other (shallower) samples collected. From the available data, soil VOCs and PAHs impacts appear to be the result of impacted groundwater within the capillary fringe, originating from outside of the excavated area, and not due to a release from the USTs at that location.

In a letter dated January 19, 2012, the RWQCB directed UPRR to address their remaining concerns from their July 22, 2011 directive letter. The remaining concerns included the removal of known shallow impacts and removal of impacted soil in the vicinity of SB-1. In addition, further investigation around the UST tank pit was directed since evidence of discharge was noted during the removal of the UST in November 2011. In April 2012, Antea Group advanced five soil borings (B1 through B5) on the southwestern boundary of the site and seven qualitative borings (B6 through B12) utilizing cone penetration testing (CPT) tip and Ultra-Violet Optical Screening Tool (UVOST) technology around the tank pit area. The borings were advanced to further investigate impacts of the UST removal and determine any contamination near the site boundaries and their origin. Soil samples were collected and submitted for laboratory analysis. Of the detection above the LRLs, only two concentrations are above their San Francisco Bay RWQCB environmental screening levels (ESLs). The DRO concentration in sample B2-11' [240 milligrams per kilogram (mg/kg)] and the concentration of DRO (810 mg/kg) detected in B4-12' exceeded the ESL of 83 mg/kg. Analysis of the UVOST data suggests that the only boring displaying minor indications of hydrocarbon impacts is boring B7 at approximately 5 to 10 feet bgs.

On July 9 through July 13, 2012 UPS and Antea Group conducted soil excavation in the area of former EBA soil boring SB-1. The results of the sidewall and base samples of the excavation in the vicinity of EBA boring SB-1 indicate that only samples from the southwest portion of the excavation exceed commercial/industrial ESLs for DRO and MORO.

On February 26, 2013, the RWQCB directed UPRR to install four monitoring wells on the site to further investigate groundwater impacts on their origin (potentially from off-site sources). Antea Group had proposed this work in their Site Remedial Action and Investigation Report dated October 16, 2012 and the RWQCB concurred. On May 5 and 6, 2013, Antea Group installed four groundwater monitoring wells (MW-1 through MW-4).

SENSITIVE RECEPTORS

Geomatrix performed a well survey in 2000. Domestic and industrial water supply for the site vicinity is provided through the City of Santa Rosa, which purchases water from the Sonoma County Water Agency (SCWA). The SCWA delivers water to the City via the Sonoma County aqueduct. The source of the water is the Russian River, which is

fed by three main upstream reservoirs. The City of Santa Rosa also has eight standby wells to pump groundwater for emergency purposes; these wells currently are not in use (Geomatrix, 2003).

Information provided by the City of Santa Rosa Utilities Department (SRUD) indicates that 50 groundwater wells are located within a half mile of the site. Of these wells, 21 are located within a half mile generally to the north (hydraulically up- and cross-gradient of the site) and 29 are located within a half mile generally to the south (hydraulically down-gradient of the site). Of the 50 wells, only four are located within a one-quarter mile radius, with two wells located approximately up gradient and two approximately down gradient. Based on conversations with SRUD personnel, only two of the residences located within one-half mile from the site are not connected to the City of Santa Rosa water supply. These residences are located at 654 and 658 Dutton Avenue. Uses for the wells are not tracked by SRUD in all cases, but records indicate that the wells within one-quarter mile of the site are used for irrigation and external use (Geomatrix, 2003).

Information about the possible presence of an additional water-producing well located near the site was provided by the RWQCB. This well was not included in the SRUD database. The well is located to the west of the site between the site and Santa Rosa Creek; its actual location has not been field-verified. At this time the well is not in use, and based on a conversation with the site redeveloper, the well will not be used in the future and will be appropriately destroyed (Geomatrix, 2003).

Appendix B

Blaine Tech Services' Groundwater Sampling Procedures

Blaine Tech Services, Inc.
Standard Operating Procedure

LOW-FLOW SAMPLING

1. Calibrate YSI Flow Cell as per manufacturer's specifications. Thoroughly rinse probe and cup between parameters. Calibration order as follows:

    A. pH (use 3-point calibration of 7, 4, 10)
    B. Oxygen Reduction Potential (ORP)
    C. Specific Conductance
    D. Dissolved Oxygen (DO) (calibrate simulating 100% oxygen saturation)

2. Remove dedicated PE tubing from the well or start with new PE tubing cut to the required length.
3. Gently lower the PE tubing into the well, placing the intake at the center of the screened interval. Take care to minimize disturbance to the water column.
4. Attach the PE tubing to the Peristaltic Pump.
5. Direct effluent line into YSI 556 Flow Cell.
6. Set Peristaltic Pump speed at 100 - 500 ml/min.
7. Collect water quality parameter measurements for temperature, pH, conductivity, turbidity, DO and ORP every 3-5 minutes.
8. Monitor drawdown during purging with electronic water level meter. Record water level with each parameter measurement. MAXIMUM DRAWDOWN IS 0.33 FEET.
9. Collect parameter measurements until stability is achieved. Stability is defined as three consecutive measurements where:

Temp	± 1° Celsius
pH	± 0.1
Conductivity	± 3%
Turbidity	± 10% NTU
DO	± 0.3 mg/l
ORP	± 10 Mv

10. Disconnect effluent line from YSI 556 Flow Cell.
11. Sample through effluent line while maintaining constant flow rate.

Project # 140227-Pw1 Date 2/27/14 Client Antea

Site UPRR Santa Rosa 24th St & 34 (6th St)

Well ID	Well Size (in.)	Time Gauged	Sheen / Odor	Depth to Immiscible Liquid (ft.)	Thickness of Immiscible Liquid (ft.)	Volume of Immiscibles Removed (ml)	Depth to water (ft.)	Depth to well bottom (ft.)	Survey Point: TOB or (TOC)
MW-1	2	0955					9.50	19.80	
MW-2	2	0959					9.73	19.60	
MW-3	2	0957					10.95	18.22	
MW-4	2	1002					7.78	18.20	↓

Groundwater Sampling Form

EPIC Site Name:	Santa Rosa, CA- 2 Fourth Street and 34 Sixth Street	Site ID:	2344
Sample ID:	WG-2344-MW1-20140227	Sample Date: (mm/dd/yy)	2/27/14
Sampler Name:	Daniel Allen	Sample Time (hhmm):	1045
Laboratory (Location):	Test America-San Francisco (Pleasanton Lab)	Sample Type: (Matrix/grab or composite?)	WG/GRAB

State-Specific Well ID: MW-1

Name of Duplicate Sample: _____ MS/MSD collected (yes/no)?: NO

Purging Equipment: _____ 2" Disposable bailer _____ Submersible pump

X Peristaltic Pump _____ Dedicated bailer

_____ 4" PVC bailer _____ Centrifugal pump

Sampled with: Disposable bailer _____ Teflon bailer _____

Disposable Tubing _____ Dedicated Equip. X

	2"	4"	6"	8"
Well Diameter:	X			
Purge Vol. Multiplier: (gal/ft.)	0.16	0.65	1.47	2.61

Start purge: 1026 @ 200 ml/min Depth to Water When Sampled: 9.49

Record the measurement and applicable unit associated with each field parameter on the below table: Stabilization within EPA low-flow standards

Time	pH	Temp Unit: °C	Cond. Unit: uS/cm	Turbidity Unit: NTU	ORP Unit: mV	DO Unit:	Volume Unit: ml
1029	6.89	16.17	419	14	85.6	1.25	600
1032	6.76	16.57	408	11	79.5	0.96	1200
1035	6.73	16.64	402	10	73.0	0.93	1800
1038	6.72	16.70	400	10	71.5	0.92	2400
1041	6.70	16.73	397	8	70.1	0.90	3000

Lock Present (yes/no): ~~NO~~ Yes

Fixtures Replaced: NO

Weather Conditions/Ambient Temperature: Overcast

Comments: Fe^{2+} = 0.0 mg/L

Signature of Sampler: [signature]

anteagroup

Groundwater Sampling Form

EPIC Site Name:	Santa Rosa, CA- 2 Fourth Street and 34 Sixth Street	Site ID:	2344
Sample ID:	WG-2344-MW2-20140227	Sample Date: (mm/dd/yy)	2/27/14
Sampler Name:	Daniel Allen	Sample Time (hhmm):	1150
Laboratory (Location):	Test America-San Francisco (Pleasanton Lab)	Sample Type: (Matrix/grab or composite?)	WG/GRAB

State-Specific Well ID: MW-2

Name of Duplicate Sample: _____ MS/MSD collected (yes/no)?: NO

Purging Equipment: _____ 2" Disposable bailer _____ Submersible pump

X Peristaltic Pump _____ Dedicated bailer

_____ 4" PVC bailer _____ Centrifugal pump

Sampled with: Disposable bailer _____ Teflon bailer _____

Disposable Tubing _____ Dedicated Equip. X

Well Diameter: 2" X 4" _____ 6" _____ 8" _____

Purge Vol. Multiplier (gal/ft.): 0.16 0.65 1.47 2.61

Start purge: 1137 @ 200 ml/min Depth to Water When Sampled: 9.85

Record the measurement and applicable unit associated with each field parameter on the below table: Stabilization within EPA low-flow standards

Time	pH	Temp	Cond.	Turbidity	ORP	DO	Volume
	6.69	Unit: C°	Unit: uS/cm	Unit: NTU	Unit: mV	Unit:	Unit: ml

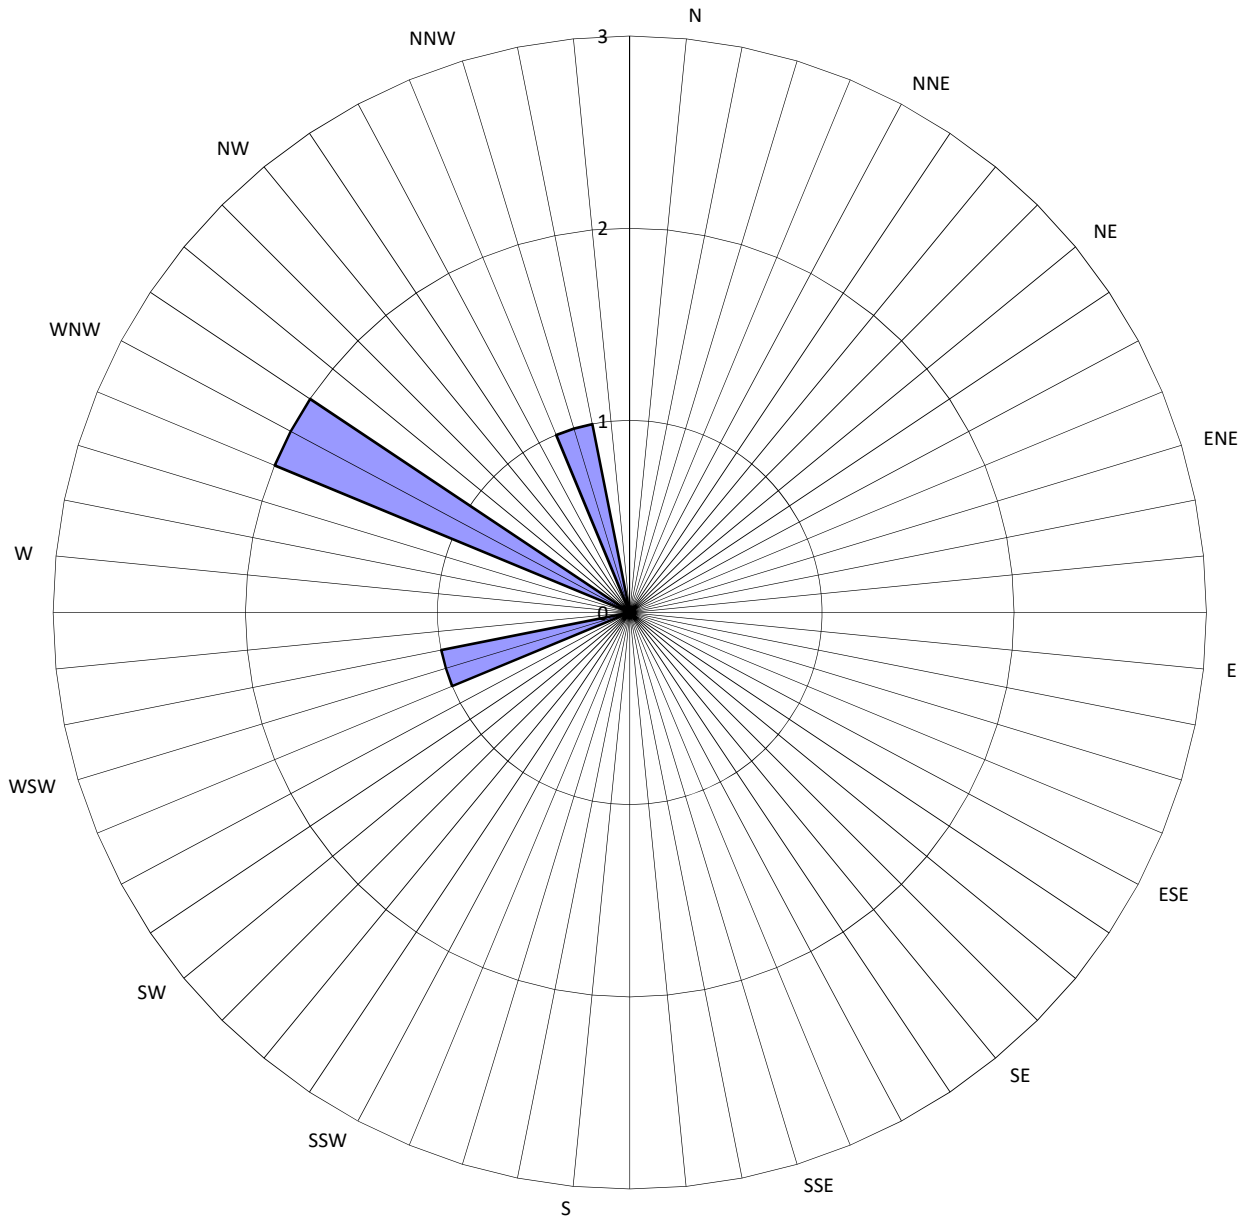
Appendix D



Groundwater Gradient and Flow Direction Data (Rose Diagram)

GROUNDWATER GRADIENT AND FLOW DIRECTION DATA
UNION PACIFIC RAILROAD
2 FOURTH STREET AND 34 SIXTH STREET
SANTA ROSA, CALIFORNIA

Monitoring Date	Groundwater Flow Direction	Groundwater Gradient (foot per foot)
May-13	West-Southwest	0.031
Aug-13	West-Northwest	0.035
Nov-13	West-Northwest	0.042
Feb-14	North-Northwest	0.012
		Average: 0.030

Notes:
Number of monitoring events = 2
- Data included in this table are from current and historical monitoring reports.

GROUNDWATER FLOW DIRECTION ROSE DIAGRAM
UNION PACIFIC RAILROAD
2 FOURTH STREET AND 34 SIXTH STREET
SANTA ROSA, CALIFORNIA

Legend:
Each concentric gridline represents the number of monitoring events.
The diagram includes data from the Second Quarter 2013 through the First Quarter 2014.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 720-55806-1

Laboratory: TestAmerica Pleasanton

Narrative

Job Narrative
720-55806-1

Comments
No additional comments.

Receipt
The samples were received on 2/28/2014 1:25 PM; the samples arrived in good condition, properly preserved and, where required, on ice.
The temperatures of the 2 coolers at receipt time were 1.3º C and 1.9º C.

GC/MS Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Detection Summary

RE: Analytical Results and Reduced Validation of Report J55806
Quarterly Groundwater Sampling
Union Pacific Railroad (UPRR) – 2 Fourth Street and 34 Sixth Street
Santa Rosa, California
February 2014

1.0 Introduction

The following document details a reduced validation of analytical results for groundwater samples collected in support of the Quarterly Groundwater Sampling at the 2 Fourth Street and 34 Sixth Street Site in Santa Rosa, California during February 2014. Samples were submitted to Test America, located in Pleasanton, California. A sample collection and analysis summary is presented in Table 1. A summary of the analytical methodology is presented in Table 2. The validated analytical results are summarized in Table 3.

Standard Conestoga--Rovers & Associates (CRA) report deliverables were submitted by the laboratory. The final results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the chain of custody form, finished report forms, method blank data, recovery data from surrogate spikes, laboratory control samples (LCS) and field QC samples.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 2 and applicable guidance from the document entitled "United States Environmental Protection Agency (USEPA) Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008 subsequently referred to as the "Guidelines" in this Memorandum.

2.0 Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in the methods. The sample chain of custody document and analytical report were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (<6°C).

EQUAL EMPLOYMENT OPPORTUNITY EMPLOYER

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

3.0 Laboratory Method Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation.

4.0 Surrogate Spike Recoveries - Organic Analyses

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for semi-volatile organic compound (SVOC) and diesel range organics (DRO)/motor oil range organics (ORO) analysis were spiked with the appropriate number of surrogate compounds prior to sample extraction.

Each individual surrogate compound is expected to meet the laboratory (method) control limits with the exception of semi-volatile organic compound (SVOC) analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against the associated control limits. All surrogate recoveries met the above criteria.

5.0 Laboratory Control Sample (LCS) Analyses

LCS and/or laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

Organic Analyses

The LCS/LCSD contained the compounds specified in the method. All LCS recoveries and RPDs were within the associated control limits, demonstrating acceptable analytical accuracy and precision.

6.0 Field QA/QC Samples

The field QA/QC consisted of one field duplicate sample set.

Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, one field duplicate sample was collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 and 100 percent for water and soil samples, respectively. If the reported concentration in either the investigative sample or its duplicate is less than five times the practical quantitation limit (PQL), the evaluation criteria is one or two times the PQL value for water and soil samples, respectively.

All field duplicate results were within acceptable agreement, demonstrating acceptable sampling and analytical precision.

7.0 Analyte Reporting

The laboratory did not report any detected concentrations below the laboratory's PQL/reporting limit (RL).

8.0 Conclusion

Based on the assessment detailed in the foregoing, the summarized data are acceptable without qualification.

Second Quarter 2014 Quarterly Monitoring Report and Case Closure Request

Union Pacific Railroad
2 Fourth Street and 34 Sixth Street, Santa Rosa, California
North Coast Regional Water Quality Control Board
Case No. 1TSR196

1.0 INTRODUCTION

On behalf of Union Pacific Railroad (UPRR), Antea®Group has prepared this *Second Quarter 2014 Quarterly Monitoring Report and Case Closure Request* for the referenced site located at 2 Fourth Street and 34 Sixth Street in Santa Rosa, California (**Figure 1**). This report includes a summary of the data obtained from the second quarter 2014 groundwater monitoring event completed on June 25, 2014, as well as an evaluation of the site against the criteria established in the *California Water Quality Control Policy for Low-Threat Underground Storage Tank Case Closure*, State Water Resources Control Board Resolution No. 2012-0016 (SB 2012-0016). This report has received a technical review by Ms. Lia Holden, California Professional Geologist #8584.

1.1 Site Description and Background

The site is currently owned by Sonoma Marin Area Rail Transit (SMART) and is used as an equipment and supply storage area for SMART construction activities taking place off site. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the "3 West Third Street and 60 West Sixth Street Warehouses", to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties (**Figure 2**).

1.2 Site History

The site was historically used as a railroad freight depot and maintenance/fueling yard from the late 1800's through the 1960's. This site has been vacant and generally unused since the late 1960's. Consultants have conducted environmental investigations and remediation efforts at the site since 1987. Former operations at the site include the use of aboveground storage tanks (ASTs), underground storage tanks (USTs), a main railroad track system that occupied the eastern portion of the property, several associated railroad spurs and siding, a turntable, warehouses, and freight houses. A Sanborn Fire Insurance map dated 1885 indicates the Santa Rosa Woolen Mills was located in the northwestern portion of the site until approximately 1906 [EBA Engineering (EBA), 2009a]. The site's previous environmental case was closed in 2007, but was a case was reopened in 2009 following the discovery of an oil UST in 2008. **Appendix A** includes a summary of environmental investigations and remedial activities conducted at the site. **Figure 2** shows the site's historic borings and well locations.

1.3 Geologic and Hydrogeologic Setting

1.3.1 Regional Geology

The site is centrally located within the Santa Rosa Plain, which is part of the Coast Range Geomorphic Province of northern California. The Coast Range Geomorphic Province is characterized as a series of northwest trending elongated ridges and valleys that are a result of folding and faulting. The Santa Rosa Plain consists of alluvial fan deposits of Pleistocene and Holocene age. The alluvial fan deposits form a nearly continuous blanket over the Santa Rosa Plain and consist of poorly sorted coarse sand and gravel, moderately sorted fine sand and silt, and silty clay. The region has been mapped as having basement materials that underlie the alluvial fan deposits. The basement materials consist of marine sedimentary rocks of the Miocene Age Wilson Grove Formation. Portions of the Wilson Grove Formation are overlain by younger continental sedimentary rocks of the Pliocene-Pleistocene Age Glen Ellen Formation (EBA, 2008b).

1.3.2 Site Geology and Hydrogeology

The geology of the project site is characterized by shallow rocky fill or organic clay in the upper one to two feet below ground surface (bgs) that is underlain by sandy silt and clayey sediments containing varying amounts of angular to sub-rounded gravel. These finer-grained sediments extend to approximately 20 feet bgs, and are underlain by a laterally continuous sandy coarse-grained unit extending to a minimum of 26 feet bgs, which is the maximum depth explored at the project site to date (EBA, 2008b). Historical boring logs are included as **Appendix B;** cross sections prepared by Antea Group are presented in **Appendix C**.

The hydrogeology of the project site is likely controlled by gradational lenses of sediments separated by clayey layers. A thin, semi-continuous sandy unit located at an average depth of approximately 9-15 feet bgs overlays a similarly laterally extensive clayey bed. The more impervious clay units likely act as confining layers inhibiting the downward vertical migration of fluids. Based on this observation, the resulting perched groundwater in the upper permeable sand unit (Zone A) has been independently sampled from the deeper water-bearing zone present at a depth of approximately 20 to 25 feet bgs (EBA, 2008). However, as EBA previously noted, wells SRMW-7 and SRMW-8 were screened across both zones. The predominant groundwater flow direction is in a predominately westerly direction, with variations from southwest to northwest.

2.0 CURRENT GROUNDWATER MONITORING

2.1 Work Performed in the Second Quarter 2014

1. Antea Group submitted the *Quarterly Monitoring Report – First Quarter 2014* to the North Coast Regional Water Quality Control Board (NCRWQCB) on April 17, 2014.
2. Antea Group's subcontractor Blaine Tech Services, Inc. (Blaine Tech) conducted quarterly groundwater gauging and sampling activities on June 25, 2014.

2.2 Work Proposed for the Third Quarter 2014

1. Antea Group will submit the *Second Quarter 2014 Quarterly Monitoring Report and Case Closure Request* to the NCRWQCB (contained herein).
2. Pending regulatory approval of the Case Closure Request, Antea Group requests to discontinue quarterly groundwater monitoring at the site.

2.3 Current Project Status

Current phase of project:	Quarterly Groundwater Monitoring; Case Closure Evaluation
Lead agency for cleanup oversight:	North Coast Regional Water Quality Control Board (Case No. 1TSR196)
Monitoring well gauging and sampling schedule:	Quarterly: MW-1, MW-2, MW-3, and MW-4
Total number of monitoring wells (**Table 1**):	Onsite: 4 wells (MW-1, MW-2, MW-3, MW-4)
Range of well depths (total depth below ground surface, bgs):	18.5 to 20.0 feet bgs
Historical depth to water range, in feet below top of casing (BTOC):	Min: 7.78 (MW-4, 2/27/14) Max: 15.53 (MW-1, 11/20/13)
Historical groundwater elevation range (ft):	Min: 136.33 (MW-1, 11/20/13) Max: 144.19 (MW-4, 2/27/14)

2.4 Regulatory Correspondence

No correspondence was exchanged during the first quarter 2014.

2.5 Groundwater Monitoring

For this groundwater monitoring event, all four onsite monitoring wells were gauged, purged, and sampled by subcontractor Blaine Tech per standard sampling protocol. Copies of Blaine Tech's field data sheets are included in **Appendix D**. The recent gauging and sampling data are summarized below.

Well gauging and sampling date:	June 25, 2014
Wells gauged and sampled:	MW-1, MW-2, MW-3 and MW-4
Purge method:	Peristaltic pump
Sample collection method:	Dedicated equipment (tubing)
Groundwater parameters measured (**Appendix D; Table 2**):	Depth to water, temperature, pH, conductivity, oxidation-reduction potential (ORP), turbidity, and dissolved oxygen (DO)
Current depth to water range of wells (ft BTOC):	Min: 9.69 (MW-4) Max: 11.43 (MW-1)
Current groundwater elevation range of wells (ft):	Min: 140.43 (MW-1) Max: 142.28 (MW-4)
Groundwater flow direction and gradient:	Northwest with a hydraulic gradient of 0.012 feet/foot

2.5.1 Groundwater Flow Gradient and Directional Trends

Using the well gauging data from June 25, 2014 and the surveyed well casing elevations (**Table 1**), Antea Group calculated the groundwater table elevation at each monitoring well location (**Table 3**). These elevations were used to calculate and plot the groundwater flow direction and gradient across the site (**Figure 3**).

Based on the second quarter 2014 data, the groundwater flow direction at the site is to the northwest with a general hydraulic gradient of 0.012 feet/foot. The groundwater flow during the second quarter 2014 is similar to the four previous sampling events, but there appears to be localized variation in the groundwater elevation in the eastern portion of the site. In historic reports, groundwater elevation contours prepared with the site's former (larger) well network showed somewhat variable localized flow patterns across the site with an overall flow toward the west-southwest, which is more directly toward Santa Rosa Creek. **Appendix E** includes flow and gradient data from both monitoring events tabulated and plotted on a rose diagram.

2.5.2 Groundwater Quality Data and Contaminant Trends

Groundwater samples collected during the second quarter 2014 sampling event were submitted under chain of custody protocol to TestAmerica Laboratories, Inc. (TestAmerica), a state of California certified laboratory (California Certification No. 2496). The submitted groundwater samples were analyzed for the following:

- Diesel range organics (DRO) by Environmental Protection Agency (EPA) Test Method 8015 with and without silica gel cleanup,
- Motor oil range organics (MORO) by EPA Test Method 8015 with and without silica gel cleanup, and
- Polycyclic aromatic hydrocarbons (PAHs) by EPA Test Method 8270C SIM.

The complete laboratory analytical report is included in **Appendix F**. Groundwater analytical results are presented in **Table 3** (current) and **Table 4** (historical); a groundwater concentration map is presented as **Figure 4**.

The laboratory reported three detections above the laboratory reporting limit (LRL). DRO was detected in monitoring wells MW-2 and MW-4 without silica gel cleanup at concentrations of 49 micrograms per liter (µg/L) and 340 µg/L, respectively. DRO with silica gel cleanup was only reported in MW-4 at a concentration of 70 µg/L. MORO was detected in monitoring well MW-4 at a concentration of 210 µg/L. MORO with silica gel cleanup was not reported above the LRL in any of the wells. As stated in the previous monitoring report, overall DRO and MORO detections may be attributed to heavily weathered residual hydrocarbons or naturally occurring carbon from organic material decomposition, and not indicative of site conditions as a result of a release. PAHs were not detected above the LRL in any of the groundwater samples during this sampling 2014 event.

2.5.3 Waste Disposal Summary

Well purge water generated during the second quarter 2014 sampling event was contained in a single Department of Transportation (DOT) approved 55-gallon drum and was temporarily stored at the site. Antea Group is currently

coordinating drum pickup and removal with subcontractor United Pumping Services, Inc. (UPS). Antea Group will include the fully executed manifest in the next quarterly monitoring report. The non-hazardous waste manifest from the fourth quarter 2013 sampling event, previously unavailable, is included as **Appendix G**.

2.5.4 Quality Assurance / Quality Control (QA/QC)

QA/QC measures included use of a field duplicate sample and a detailed QA/QC data validation check on the TestAmerica laboratory analytical results for the June 2014 sampling event performed by Conestoga-Rovers and Associates (CRA). The TestAmerica laboratory report and CRA validation memo is included as **Appendix F**. A summary of QA/QC information follows.

Duplicate (WG-2344-DUP1-250614) collected at parent sample MW-4:	Contaminant concentrations were not detected above the LRL for the duplicate sample, while the parent sample reported DRO with silica gel at 70 µg/L (See validation memo in **Appendix F**)
Laboratory QA/QC Performed:	Yes (memo provided by CRA)
Laboratory Data Qualifiers:	No data qualifiers were indicated in the laboratory report; although this lab report was revised to correct reported values of DRO and MRO for the duplicate sample.
Are the data valid for their intended purpose?	Yes, the data are valid

After review of the laboratory validation provided by CRA, Antea Group concludes that the laboratory data obtained during this groundwater sampling event are valid for their intended purpose.

3.0 LOW RISK CASE CLOSURE EVALUATION

3.1 General Site Criteria

This section reviews general criteria evaluated by Antea Group to determine if the site poses a low risk to human health and the environment.

3.1.1 Public Water System Availability

The site is located in the Sonoma County Water Agency (SCWA) water service area. The primary source of water for the SCWA is the Russian River via aqueducts and the secondary source is a collection of reservoirs/tanks located in higher elevations of Santa Rosa.

3.1.2 Unauthorized Release Consists Only of Petroleum Hydrocarbons, and has been stopped

According to EBA Engineering's (EBA) Phase I Environmental Site Assessment dated March 2008, the site is documented as a railroad freight depot and maintenance and fueling yard from the late 1800s up to the 1960s. In a Sanborn Fire Insurance Map dated 1885; the northwestern portion of the site is shown as Santa Rosa Woolen

Mills. This map shows a large structure with a 30,000-gallon above ground water tank. Apart from the Santa Rosa Woolen Mills, there is no indication of past use being anything other than railroad operations (EBA, 2008a).

During a 2008 geophysical survey, EBA discovered an undocumented 550-gallon UST and subsequently oversaw the evacuation of contents within the tank (EBA, 2008b). In November 2011 and under the supervision of Antea Group, UPS removed the 550-gallon UST. During the initial daylighting of this tank, UPS discovered an additional 500-gallon oil UST adjacent to the 550-gallon UST. UPS subsequently removed this tank. There is no other indication of a release occurring at the site for this particular case.

3.1.3 Free Product Removal

Approximately 500 gallons of oily water was pumped from the excavation pit and properly disposed. Non-aqueous phase liquid (NAPL) has not been reported in soil or groundwater since the 2011 UST removal event, including samples collected in 2012 from borings immediately surrounding the tank excavation area.

3.1.4 Site Conceptual Model (SCM)

In January 2003 Geomatrix prepared a SCM for the site prior to case closure in 2007. Antea Group has not completed a comprehensive site conceptual model (SCM) for this case; however, the data contained herein satisfies the criteria for a SCM. Additionally, supporting data and analyses used to develop this report, are contained in previous investigation reports submitted to NCRWQCB since the case was opened (refer to reports listed in **Appendix A**).

3.1.5 Secondary Source Removal

UPS excavated and disposed of approximately 213 tons of hydrocarbon-impacted soil during the November 2011 UST removal activities. Additionally, approximately 500 gallons of oily water was pumped from the excavation pit and properly disposed.

In July 2012, Antea Group oversaw UPS excavate contaminated soils in the area of former EBA boring SB-1. Approximately 758 tons of soil was excavated and transported offsite for disposal. UPS also pumped approximately 1,500 gallons of water from the base of this excavation and transported it offsite for disposal.

Antea Group believes that remedial efforts implemented at the site (both before the 2007 case closure and following the 2009 case opening) have effectively removed secondary source material to the extent practicable. For a list of additional secondary source removal activities with the previous case, refer to **Appendix A**.

3.1.6 MTBE in Soil and Groundwater

Both soil and groundwater were analyzed for MTBE during assessment and monitoring events for the site's previous environmental case in accordance with Health and Safety Code section 25296.15. Results of the soil and

groundwater testing were reported in the previous site assessment reports submitted to the NCRWQCB and the California State Water Resources Control Board (CRWQCB) GeoTracker database.

3.1.7 Nuisance Does Not Exist at the Site

A nuisance, as defined by Water Code Section 13050-13051 is defined by the following criteria:

1) Is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property;
2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal;
3) Occurs during, or as a result of, the treatment or disposal of wastes;

Based on this definition, the site is not considered a nuisance.

3.2 Groundwater

This section reviews criteria specific to the risk to human health and the environment associated with contamination in groundwater. The SB 2012-0016 document only establishes groundwater criteria for MTBE and benzene concentrations. At the site, the primary COCs are DRO and MORO; SB 2012-0016 does not consider these components when evaluating risk to human health and the environment via the groundwater pathway. For the purpose of evaluating plume stability (required under SB 2012-0016), in the following sections, Antea Group will discuss DRO and MORO plumes in accordance with case closure guidelines.

3.2.1 Plume Stability

Antea Group evaluated plume stability in site wells (MW-1 through MW-4) based on time series graphs showing DRO and MORO concentrations over time. Time series graphs showing DRO and MORO concentrations over time in wells MW-1 through MW-4 indicate stable trends at low-level to non-detect concentrations (**Appendix H**). If a given analytical concentration was below the respective laboratory reporting limit, then half of that value was used for the graphs.

MW-3 has not reported DRO and MORO above laboratory reporting limits with and without silica gel cleanup. MW-1 and MW-2 have periodically reported minor concentrations of DRO without silica gel since groundwater sampling was initiated in May 2013 (**Table 3**); however, concentrations are below the San Francisco Bay Regional Water Quality Control Board's (SFBRWQCB) environmental screening levels (ESLs). Well MW-4, upgradient of the other site wells, has reported DRO and MORO without silica gel since August 2013 and November 2013, respectively. Using silica gel cleanup, DRO and MORO have not been reported above the laboratory reporting limits since sampling was initiated, with one exception. The second quarter 2014 sampling event shows DRO with silica gel at a concentration of 70 µg/L.

3.2.2 Plume Definition

Based on analytical data from site wells, the dissolved-phase DRO and MORO plumes are generally limited to MW-4 (**Table 3; Figure 4**).

3.2.3 Sensitive Receptors

A detailed discussion of sensitive receptors is included in **Appendix A**. As reported in 2003, there were approximately 50 groundwater wells within a half-mile of the site; of the 50 wells, only two were located in the general down-gradient direction of the site. These wells were reportedly used for irrigation and external purposes. Furthermore, the RWQCB indicated there is a water-producing well located west and in between the site and Santa Rosa Creek. This well was reportedly not in use in 2003 and will remain inactive (Geomatrix, 2003). Additionally, Santa Rosa Creek is located approximately 160 feet west (cross gradient) of the subject site (EBA, 2008b).

- Although Santa Rosa Creek and identified wells are located downgradient of the subject site, based on groundwater analytical concentrations since the case was reopened in 2009, they are not considered at risk from residual onsite DRO and MORO.

3.2.4 Benzene and MTBE Concentrations

Benzene and MTBE are not currently constituents of concern (COCs) at the site. During a 2008 investigation, benzene was not reported above LRLs in any grab groundwater samples collected (**Appendix I**). During this same investigation, MTBE was reported at a maximum concentration of 47.1 µg/L (SB-6-W; 10/6/ 2008), well below the SB 2012-0016 threshold of 1,000 µg/L.

At the time of the previous case closure in 2007, benzene and MTBE were only analyzed in wells SRMW-07 and SRMW-08 from 2001 to 2006. Benzene was not reported above LRLs in any groundwater samples collected at the site. The maximum concentration of MTBE in monitoring wells between 2001 and 2004 was reported at 23 µg/L (SRMW-08; 9/16/2004); SRMW-08 was an upgradient well. The historical maximum concentration of MTBE in the site's history was 120 µg/L reported in grab groundwater sample SRB-58 in September 2001. Maximum concentrations of MTBE did not exceeded the SB 2012-0016 threshold criteria of 1,000 µg/L for all historical groundwater sampling activities (**Appendix I**).

3.3 Petroleum Vapor Intrusion to Indoor Air

The site is currently being redeveloped into a SMART Rail Station which will include a rail station, and a mixture of residential and commercial buildings. Antea Group does not anticipate vapor intrusion to be a potential issue at the site due to the low to non-detectable levels of volatile organic compounds associated with the site. The site's COCs consist of heavy range hydrocarbons (DRO and MORO) and to a lesser extent, associated PAHs. Naphthalene is the only COC which has an ESL for potential groundwater to vapor intrusion. The maximum concentration of

naphthalene reported in the current monitoring network was 1.2 ug/L which is below the ESL of 160 ug/L, hence there does not appear to be a potential threat of vapor intrusion due to current dissolved phase analyte concentrations.

3.4 Direct Contact and Outdoor Air Exposure

This section reviews criteria associated with direct contact and outdoor air exposure. Direct contact and outdoor air exposure is influenced by contamination found in soils from 0 to 10 feet bgs, taking into account benzene, ethylbenzene, naphthalene, and PAHs (if historical waste-oil or Bunker C fuel were released at the site). The threshold values referenced are included as an excerpt from the SB 2012-0016 *Technical Justification for Soil Screening Levels for Direct Contact and Outdoor Air Exposure Pathways* below:

TABLE 1†

Chemical	Residential		Commercial/Industrial		Utility Worker
	0' - 5' bgs mg/kg	Volatilization to outdoor air (5' - 10' bgs) mg/kg	0' - 5' bgs mg/kg	Volatilization to outdoor air (5' - 10' bgs) mg/kg	0' - 10' bgs mg/kg
Benzene	1.9	2.8	8.2	12	14
Ethylbenzene	21	32	89	134	314
Naphthalene	9.7	9.7	45	45	219
PAH[19]*	0.063	Not applicable	0.68	Not applicable	4.5

*Sampling/analysis for PAH is only necessary where soil was affected by either waste oil or Bunker C fuel.

†Area of impacted soil where a par. cular exposure occurs is 25 x 25 meters (~82' x 82') or less.

Neither benzene nor ethylbenzene are COCs based on historical soil concentrations associated with the previous case; therefore they were removed from the sampling analysis suite when the case reopened. The maximum concentration of naphthalene was reported at 82.3 milligrams per kilogram at a depth of 7.5 feet bgs in 2008 (SB-1A). While this concentration exceeds the commercial/industrial threshold values, the area at and around SB-1A was excavated in 2012; subsequent confirmation sampling from the 2012 excavation showed no reported naphthalene concentrations. Furthermore, soil sampling events occurring in 2011, 2012, and 2013 do not indicate naphthalene above the laboratory reporting limits for any samples collected.

While there were low level PAH analytical results reported in soil samples collected in 2011, 2012, and 2013, no samples in the upper 10 feet of the site contained PAH concentrations which collectively had a benzo(a)pyrene toxicity equivalent (BaPE) exceeding the residential value of 0.063 mg/kg. Only one sample collected by EBA in 2008 exceeded the residential BaPE (SB-28@2'; BaPE was 0.36 mg/kg), but was below the commercial/industrial value. The soil sample from SB-28@5' showed no PAH detections. Based on the above criteria, shallow soil contamination appears to be limited in extent and does not appear to pose a significant threat to human health or the environment.

Table 5 summarizes all historical soil analytical data going back to 2011. Prior to that, historical soil data is included in **Appendix J**.

4.0 CONCLUSIONS AND RECOMMENDATIONS

Upon evaluating the site against SB 2012-0016 criteria, Antea Group concludes the following:

- The primary sources have been removed and secondary source material has been addressed to the extent practicable.
- The contaminant plume is stable to decreasing and limited in extent to MW-4.
- There are no sensitive receptors that appear to be affected by or at risk from the site contaminant plume based on recent analytical data, definition of the plume and limited means of exposure.
- Benzene and MTBE are not COCs at the site; DRO and MORO are the only COCs at the site. DRO and MORO concentrations (with silica gel cleanup) have not exceeded the ESLs since groundwater monitoring and sampling was initiated at wells MW-1 through MW-4.
- There does not appear to be a threat to vapor intrusion from the site's current dissolved phase hydrocarbon and PAH plume.
- Shallow soil samples (0 to 10 feet bgs) collected since case closure are below the SB 2012-0016 criteria for a commercial/industrial site. With the exception of one isolated sample (SB-28@2'), shallow soil collected since case closure also meets the residential criteria (**Section 3.4**).

Based on the evaluation against SB 2012-0016 criteria, Antea Group does not consider the contaminant release associated with the subject site to be a risk to human health or the environment. Antea Group recommends the site be closed and no further action required. Additionally, Antea Group requests to discontinue groundwater monitoring and sampling while the agency reviews the case for closure.

5.0 LIMITATIONS

The findings contained in this report represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. For any reports cited that were not generated by Antea USA, Inc., the data from those reports are used "as is" and is assumed to be accurate. Antea USA, Inc. does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. This report is based upon a specific scope of work requested by the client. The Contract between Antea Group and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea Group's Client and anyone else specifically listed on this report. Antea Group will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea Group makes no express or implied warranty as to the contents of this report.

Notes:

ug/L micrograms per liter
< Analyte not detected at the laboratory indicated reporting limit
Bolded Value Indicates result of analysis is above the laboratory reporting limit
-- Not Analyzed
B12"A" - "A" indicates that the water sample was collected from shallow/perched water zone
B12"B" - "B" indicates that the water sample was collected from the deep water zone

Analyte Definitions:

DRO - Diesel Range Organics, carbon range C_{10} - C_{28}
MORO - Motor Oil Range Organics, carbon range C_{24} - C_{36}
SGC - Silica Gel Cleanup
PAHs - Polycyclic Aromatic Hydrocarbons

Analytical Notes

4 - Analyzed by EPA Method 6010 (Mercury analyzed by EPA Method 7471A)

Appendix A

Site Details and Summary of Previous Environmental Investigations

SITE DETAILS

Currently, the site is being used as a construction equipment supply storage area for Sonoma Marin Area Rail Transit (SMART) construction activities taking place off site. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the 3 West Third Street and 60 West Sixth Street Warehouses, to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties.

There are currently four groundwater monitoring wells (MW-1 through MW-4) at the site; quarterly groundwater sampling and monitoring is underway.

PREVIOUS INVESTIGATION AND SITE HISTORY SUMMARY

Over the history of environmental activities at the site, laboratories and consultants have used a wide variety of terms for petroleum hydrocarbons reported in analysis of soil and water. Soil and groundwater samples are analyzed typically by Environmental Protection Agency (EPA) method 8015B or 8260B. Antea Group uses the designation GRO for total petroleum hydrocarbons as gasoline within the C_5 to C_{10} carbon range, DRO for total petroleum hydrocarbons as diesel within the C_{10} to C_{28} carbon range, and RRO for total petroleum hydrocarbons as residual range organics (oil) within the C_{24} to C_{40} carbon range.

Terms from previous reports may include total recoverable petroleum hydrocarbons (TRPH), total purgeable petroleum hydrocarbons (TPPH) for GRO, total extractable petroleum hydrocarbons (TEPH) for DRO, and total volatile hydrocarbon (TVH) which refers to a broad carbon range. More specific historical terms are total petroleum hydrocarbons as gasoline (TPHg or TPH-G), total petroleum hydrocarbons as diesel (TPHd or TPH-D), and total petroleum hydrocarbons as oil or motor oil (TPHo, TPHmo, TPH-O, or TPH-MO). The designations are generally comparable to GRO, DRO, and RRO. Antea Group has left the original designation when summarizing historic data and the current designations when applied to recent investigations and summary discussions.

SITE HISTORY

In December 1987, Canonie Environmental Services Corporation (Canonie) removed three USTs from the site. These included a 230-gallon fuel oil UST, a 10,000-gallon diesel UST, and a 10,000-gallon gasoline UST, which were located within and northwest of the existing fenced enclosure. During UST removal activities, no holes or signs of leakage or overfilling were noted for any of the tanks. TPH were not detected above laboratory reporting limits in the soil samples collected from beneath the USTs (Industrial Compliance [IC], 1992).

In April 1990, the North Coast Regional Water Quality Control Board (RWQCB) drilled four borings in the western portion of the property and installed monitoring wells in two of the borings (MW-2 and MW-3). Monitoring well MW-3 was located approximately 100 feet down gradient (to the southwest) of the former fuel oil UST. Based on

information presented in a July 1992 report by IC, analytical results for samples collected from the RWQCB borings showed that no petroleum hydrocarbons were present in soil samples collected from soil boring B-1. However, oil and grease was present in the soil sample collected from boring B-1 at 12 feet bgs at a concentration of 200 milligrams per kilogram (mg/kg). Additionally, this sample contained low concentrations of polynuclear aromatic hydrocarbons (PAHs). Soil samples collected at depths of 6 and 16 feet below ground surface (bgs) from soil boring MW-3 contained petroleum hydrocarbons quantified as diesel (TPHd) at concentrations of 11 and 30 mg/kg, respectively. No petroleum hydrocarbons were detected in the groundwater sample collected by the RWQCB from monitoring well MW-2; TPHd was detected at a concentration of 0.4 milligrams per liter (mg/l) in the groundwater sample collected at monitoring well MW-3 (Geomatrix Consultants, Inc. [Geomatrix], 2000).

Soil and grab groundwater samples were collected from five borings located near the former UST area by IC in 1992. No detectable concentrations of petroleum hydrocarbons, benzene, toluene, ethylbenzene, or xylenes (BTEX compounds), or PAHs were reported in any of the soil samples collected. Grab groundwater samples collected from the location of the former diesel and gasoline USTs did not contain petroleum hydrocarbons or BTEX above laboratory reporting limits. The grab groundwater sample collected from the former fuel oil tank location reportedly contained TPHd at concentrations of 31 mg/l; no gasoline or BTEX compounds were detected in the grab groundwater sample collected from IC-B6 (Geomatrix, 2000).

The RWQCB destroyed monitoring wells MW-2 and MW-3 in June 1995. In November 1996, Geomatrix performed an investigation of soil and groundwater at the site to evaluate potential significant environmental impacts resulting from historical features or features identified during previous investigations and to respond to a request by the RWQCB to perform additional characterization in the vicinity of the former underground fuel oil tank. Twelve borings (SRB20 through SRB31) were drilled and samples were analyzed for TPHd, total petroleum hydrocarbons quantified as motor oil (TPHmo), PAHs, metals, and volatile organic compounds (VOCs). Soil samples collected for analyses of TPHd, PAHs, and metals were composited vertically from each boring; discrete samples subsequently were analyzed if elevated concentrations of constituents were detected. Only discrete samples were analyzed for VOCs. Petroleum hydrocarbons were detected in soil at elevated concentrations in boring SRB20 and SRB21, however the presence of petroleum hydrocarbons at these locations decreased with depth. Specifically, the shallower composite sample from SRB20 contained TPHmo at a concentration of 900 mg/kg. Discrete samples from depths of 4.0 and 6.5 feet contained TPHmo at concentrations of 69 mg/kg and less than 5 mg/kg, respectively. No TPHd was detected in soil samples from boring SRB20. In SRB21, TPHmo was present at a concentration of 510 mg/kg in the shallow composite sample; no TPHmo was detected in deeper, discrete samples from this boring. Shallow composite and deeper discrete soil samples from boring SRB21 contained TPHd, at a maximum concentration of 1,600 mg/kg. The concentration of TPHd in this boring decreased with depth and was not detected in the sample collected from 13.5 feet bgs (Geomatrix, 2000).

PAHs were detected in soil at concentrations below 1996 EPA screening criteria for industrial exposure. Concentrations of PAHs detected at this time are also below current PRGs (USEPA, 1999). For example, the maximum detected concentration of benzo(a)pyrene was 0.026 mg/kg in the discrete sample collected from a

depth of 12.5 feet bgs in boring SRB22; the current PRG for benzo(a)pyrene is 0.29 mg/kg. The highest PAH concentration detected was in the discrete soil sample collected from a depth of 7 feet bgs in boring SRB22. In this sample, flourene was detected at a concentration of 0.87 mg/kg; the PRG for flourene is 33,000 mg/kg. Metals concentrations in soil were within expected background concentrations and less than 10 times the soluble threshold limit concentration (STLC)4 in all of the soil samples (discrete and composite). Concentrations of metals in soil samples also were below industrial PRGs. No TPHd, TPHmo, or VOCs were detected in groundwater above laboratory reporting limits. The results of the 1996 sampling program indicated no significant environmental issues at the site. However, based on its review of the results of the November 1996 work, the RWQCB requested that additional issues be addressed before case closure would be considered. These items, which are the focus of the work described herein, include additional evaluation of historical features, potential leachability of petroleum hydrocarbons, and groundwater quality at various site locations (Geomatrix, 2000).

In September 2001, five on-site and off-site groundwater monitoring wells were installed to characterize impacts to groundwater at the project site. A majority of wells were installed in the area of the aforementioned Santa Rosa Woolen Mills facility in the northwest portion of the project site. An up-gradient, single-screen monitoring well was installed on the eastern portion of the property in vicinity of the main line railroad tracks.

Extensive investigative activities were performed in 2002 on the northwest area of the project site at the historical location of the Santa Rosa Woolen Mills Facility. Soil samples collected as part of an investigation within this area reported significant concentrations of petroleum hydrocarbons present in soil and groundwater in the area of the fueling structures, the area of the former above ground fuel storage tank (AST), and the location of a former UST. Impacts to soil were identified as being primarily heavy range petroleum hydrocarbons. From June 2002 to November 2002, an additional characterization was performed in the northwestern area and a fenced enclosure at the property. Soil samples collected from these areas indicated significant concentrations of diesel and motor oil in soil. Proposed remedial options included excavation and removal of accessible impacted soil (EBA, 2008b).

In October and November 2003, approximately 6,500 cubic yards of impacted soil were removed from several areas of the project site. The most significant remediation efforts targeted the northwestern portion of the project site where several areas were excavated to remove impacted soil. Source removal activities began in the area of a former wooden UST that is indicated on historic Sanborn maps for the Santa Rosa Woolen Mills facility. During the excavation activities, remnants of the former UST were found and removed, whereupon the excavation was advanced to a total depth of approximately 18 feet bgs. A significant amount of free-phase petroleum hydrocarbon product was encountered on the groundwater surface during the excavation activities. The product and water was subsequently pumped, treated, and disposed of to the sanitary sewer. The excavation in this area, which resulted in the removal of approximately 700 cubic yards of impacted materials, proceeded to within 20 feet of the existing Sixth Street Warehouse and was subsequently terminated due to concerns of structure stability. Confirmation soil samples indicated that impacted materials containing significant concentrations of diesel and motor oil remained in place in the excavation sidewalls and groundwater in this area (EBA, 2008b).

Excavation activities in the northwestern portion of the property also included the removal off a fuel pipeline. The associated trench was enlarged as it encountered impacted materials in an area designated as the main pit excavation area. A total of 350 cubic yards of impacted materials were removed from this area. The excavation pit extended to depths below first encountered groundwater, which was encountered at approximately 19 feet bgs. The maximum depth attained by the excavation was approximately 22 feet bgs. Impacted groundwater encountered within the excavation pit, which included free-phase petroleum hydrocarbon product, was subsequently removed using pumps, treated, and disposed of to the sanitary sewer (EBA, 2008b).

Additional excavation was also performed on the south side of the aforementioned product line trench in the northwestern area. Approximately 325 cubic yards of impacted soil was removed from this area. Approximately 270 cubic yards of impacted soil was excavated and removed in the southwestern side of the project site identified as the "southern warehouse area" (EBA, 2008b).

Quarterly groundwater monitoring performed in the northwestern portion of the project site property and west into the neighboring property parcel indicated low levels of petroleum hydrocarbons in a monitoring well identified as SRMW-13 located in the northwest corner of the property. In addition, the fuel oxygenate methyl tert-butyl ether (MTBE) was detected in SRMW-8 located on the northeast side of the property. The remaining monitoring wells appear to have been relatively free of impacts during the time monitored (EBA, 2008b).

The RWQCB issued a *No Further Action* (NFA) letter for the previous case at the site on August 31, 2007. In 2008, Sonoma Marin Area Rail Transit District (SMART) granted an option to purchase the site, formerly owned by Northwestern Pacific Railroad Authority (NWRPA) to New Railroad Square Associates, LLC for transit-oriented development purposes. In anticipation of property ownership for the site, New Railroad Square Associates, LLC (with consent from SMART) contracted the services of EBA Engineering (EBA) to perform environmental assessment activities. EBA's November 2008 *Comprehensive Report on Findings* concluded that on-site hazardous materials presently exist at various locations on the property. These materials include an underground oil storage tank (UST), heavy hydrocarbon soil and groundwater impacts in the vicinity of soil boring SB-1, and impacted shallow soil across the site. The RWQCB reopened the environmental case for the site on January 16, 2009 based on EBA's findings.

In a letter dated February 4, 2011, the RWQCB directed UPRR to remove the oil UST on the property due to SMARTs site improvement activities planned for the site. Another letter, dated July 22, 2011, was submitted to UPRR from the RWQCB which directed them to remove "known shallow impacts", soil impacts encountered during property development and removal of impacted soil in the vicinity of SB-1 in addition to the removal of the oil UST. In November 2011, United Pumping Services (UPS) removed the UST as directed. However, during the initial day-lighting activities of the oil UST, an additional 500-gallon UST containing oil was discovered adjacent and west of the known tank. UPS evacuated, cleaned and removed the second UST in conjunction with the known UST. UPS excavated and disposed of approximately 213.03 tons of impacted soil surrounding the USTs, and pumped

approximately 500 gallons of oil impacted groundwater from the excavation. Antea Group collected 16 soil samples and one grab groundwater sample from within the excavation. Based on the distribution of MORO, DRO, VOCs, and PAHs, it appears that a release from the removed USTs only affected the immediate soils surrounding the USTs. Sidewall samples NWB and SWB collected at 15 feet bgs reported concentrations of VOCs and PAHs not found in any other (shallower) samples collected. From the available data, soil VOCs and PAHs impacts appear to be the result of impacted groundwater within the capillary fringe, originating from outside of the excavated area, and not due to a release from the USTs at that location.

In a letter dated January 19, 2012, the RWQCB directed UPRR to address their remaining concerns from their July 22, 2011 directive letter. The remaining concerns included the removal of known shallow impacts and removal of impacted soil in the vicinity of SB-1. In addition, further investigation around the UST tank pit was directed since evidence of discharge was noted during the removal of the UST in November 2011. In April 2012, Antea Group advanced five soil borings (B1 through B5) on the southwestern boundary of the site and seven qualitative borings (B6 through B12) utilizing cone penetration testing (CPT) tip and Ultra-Violet Optical Screening Tool (UVOST) technology around the tank pit area. The borings were advanced to further investigate impacts of the UST removal and determine any contamination near the site boundaries and their origin. Soil samples were collected and submitted for laboratory analysis. Of the detection above the LRLs, only two concentrations are above their San Francisco Bay RWQCB environmental screening levels (ESLs). The DRO concentration in sample B2-11' [240 milligrams per kilogram (mg/kg)] and the concentration of DRO (810 mg/kg) detected in B4-12' exceeded the ESL of 83 mg/kg. Analysis of the UVOST data suggests that the only boring displaying minor indications of hydrocarbon impacts is boring B7 at approximately 5 to 10 feet bgs.

On July 9 through July 13, 2012 UPS and Antea Group conducted soil excavation in the area of former EBA soil boring SB-1. The results of the sidewall and base samples of the excavation in the vicinity of EBA boring SB-1 indicate that only samples from the southwest portion of the excavation exceed commercial/industrial ESLs for DRO and MORO.

On February 26, 2013, the RWQCB directed UPRR to install four monitoring wells on the site to further investigate groundwater impacts on their origin (potentially from off-site sources). Antea Group had proposed this work in their Site Remedial Action and Investigation Report dated October 16, 2012 and the RWQCB concurred. On May 5 and 6, 2013, Antea Group installed four groundwater monitoring wells (MW-1 through MW-4).

SENSITIVE RECEPTORS

Geomatrix performed a well survey in 2000. Domestic and industrial water supply for the site vicinity is provided through the City of Santa Rosa, which purchases water from the Sonoma County Water Agency (SCWA). The SCWA delivers water to the City via the Sonoma County aqueduct. The source of the water is the Russian River, which is

fed by three main upstream reservoirs. The City of Santa Rosa also has eight standby wells to pump groundwater for emergency purposes; these wells currently are not in use (Geomatrix, 2003).

Information provided by the City of Santa Rosa Utilities Department (SRUD) indicates that 50 groundwater wells are located within a half mile of the site. Of these wells, 21 are located within a half mile generally to the north (hydraulically up- and cross-gradient of the site) and 29 are located within a half mile generally to the south (hydraulically down-gradient of the site). Of the 50 wells, only four are located within a one-quarter mile radius, with two wells located approximately up gradient and two approximately down gradient. Based on conversations with SRUD personnel, only two of the residences located within one-half mile from the site are not connected to the City of Santa Rosa water supply. These residences are located at 654 and 658 Dutton Avenue. Uses for the wells are not tracked by SRUD in all cases, but records indicate that the wells within one-quarter mile of the site are used for irrigation and external use (Geomatrix, 2003).

Information about the possible presence of an additional water-producing well located near the site was provided by the RWQCB. This well was not included in the SRUD database. The well is located to the west of the site between the site and Santa Rosa Creek; its actual location has not been field-verified. At this time the well is not in use, and based on a conversation with the site redeveloper, the well will not be used in the future and will be appropriately destroyed (Geomatrix, 2003).

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 720-58298-1

Laboratory: TestAmerica Pleasanton

Narrative

Job Narrative
720-58298-1

Comments
The report is revised to correct results for DRO/MRO for sample #5..

Receipt
The samples were received on 6/26/2014 3:05 PM; the samples arrived in good condition, properly preserved and, where required, on ice.
The temperature of the cooler at receipt was 1.3º C.

GC/MS Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

GC Semi VOA
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

RE: Analytical Results and Reduced Validation of Report J58298
Quarterly Groundwater Sampling
Union Pacific Railroad (UPRR) - 2 Fourth Street and 34 Sixth Street
Santa Rosa, California
June 2014

1.0 Introduction

The following document details a reduced validation of analytical results for groundwater samples collected in support of the Quarterly Groundwater Sampling at the 2 Fourth Street and 34 Sixth Street Site in Santa Rosa, California during June 2014. Samples were submitted to TestAmerica, located in Pleasanton, California. A sample collection and analysis summary is presented in Table 1. A summary of the analytical methodology is presented in Table 2. The validated analytical results are summarized in Table 3.

Standard Conestoga-Rovers & Associates (CRA) report deliverables were submitted by the laboratory. The final results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the chain of custody form, finished report forms, method blank data, recovery data from surrogate spikes, laboratory control samples (LCS) and field QC samples.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 2 and applicable guidance from the document entitled "USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review", USEPA 540-R-08-01, June 2008 subsequently referred to as the "Guidelines" in this Memorandum.

2.0 Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in the methods. The sample chain of custody document and analytical report were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

EQUAL EMPLOYMENT OPPORTUNITY EMPLOYER

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (<6°C).

3.0 Laboratory Method Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation.

4.0 Surrogate Spike Recoveries - Organic Analyses

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for semivolatile organic compound (SVOC) and diesel range organics (DRO)/motor oil range organics (ORO) analysis were spiked with the appropriate number of surrogate compounds prior to sample extraction.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against the associated control limits. All surrogate recoveries met the above criteria.

5.0 Laboratory Control Sample (LCS) Analyses

LCS and/or laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

Organic Analyses

The LCS/LCSD contained the compounds specified in the method. All LCS recoveries and RPDs were within the associated control limits, demonstrating acceptable analytical accuracy and precision.

6.0 Field QA/QC Samples

The field QA/QC consisted of one field duplicate sample set.

Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, one field duplicate sample was collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 and 100 percent for water and soil samples, respectively. If the reported concentration in either the investigative sample or its duplicate is less than five times the practical quantitation limit (PQL), the evaluation criteria is one or two times the PQL value for water and soil samples, respectively.

All field duplicate results were within acceptable agreement, demonstrating acceptable sampling and analytical precision.

7.0 Analyte Reporting

The laboratory did not report any detected concentrations below the laboratory's PQL/reporting limit (RL).

8.0 Conclusion

Based on the assessment detailed in the foregoing, the summarized data are acceptable without qualification.

Notes:

1. Samples collected by Geomatrix Consultants, Inc. on November 14 and 15, 1996 and March 6 and 7, 2000. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California; TPHd and TPHm were analyzed using EPA Method 8015 following silica gel cleanup procedure EPA Method 3630C and VOCs were analyzed for using EPA Method 8240. Samples analyzed by Entech Analytical, Inc. of Sunnyvale, California and analyzed for TPHd and TPHm using EPA Method 8015M following silica gel cleanup procedure per method 3630C; PNAs using EPA Method 8270SIM; and VOCs including MTBE and other fuel oxygenates using EPA Method 8260. Samples that were collected in 2000 for TPHd, TPHm, and PNAs were analyzed before and after passing through a 0.7 micron galss fiber filter.
2. Chloroform was detected in equipment blank sample at a concentration of 9.6 µg/l.
3. Lab sheet indicates that result is quantified as diesel; chromatographic pattern not typical of fuel.
4. Results of sample/blink duplicate sample (labeled SRB46) are shown.

Abbreviations:

TPHd = total petroleum hydrocarbons quantified as diesel
TPHm = total petroleum hydrocarbons quantified as motor oil
f = filtered with 0.7 micron glass fiber filter
PNAs = polynuclear aromatic hydrocarbons
MTBE = methyl tertiary butyl ether
VOCs = volatile organic compounds
ND = not detected above laboratory reporting limits (for VOCs: 5 to 100 µg/l).

Notes:

[1] PNAs detected in boring RBB-1 include naphthalene (2.08 mg/kg); 2-methylnaphthalene (1.15 mg/kg); acenaphthalene (1.45 mg/kg); dibenzofuran (1.13 mg/kg); fluorene (1.38 mg/kg); phenanthrene (3.86 mg/kg); anthracene (0.557 mg/kg), and benzo(a)anthracene (0.324 mg/kg).

[2] GW-24 and GW-27 were installed on behalf of Mead Clark. The analytical results for GW-24 and GW-27 show only the monitoring events in which constituents were detected. Six monitoring events have been performed (4/88, 6/88, 10/88, 1/89, 4/89, 7/89). Chlorinated volatile organic compounds (CVOCs) were tested for only in 4/88. Additional groundwater sampling was conducted at monitoring well GW-24 for TPHg and BTEX (2/90, 6/90, and 10/90).

Abbreviations:

TPHg = total petroleum hydrocarbons quantified as gasoline
TPHd = total petroleum hydrocarbons quantified as diesel
TPHmo = total petroleum hydrocarbons quantified as motor oil
TPHog = total petroleum hydrocarbons quantified as oil & grease
TPHk = total petroleum hydrocarbons quantified as kerosene
RWQCB = Regional Water Quality Control Board - North Coast Region
BTEX = benzene, toluene, ethylbenzene, and xylenes
PAHs = polynuclear aromatic hydrocarbons
CVOCs = chlorinated volatile organic compounds
feet bgs = feet below ground surface
NA = not available
ND = not detected above the laboratory detection limit
PCE = tetrachloroethene

Notes:

[1] Monitoring well groundwater samples collected by Geomatrix Consultants, Inc., and analyzed by Severn Trent Laboratories (STL) San Francisco of Pleasanton, California for benzene, toluene, ethylbenzene, and total xylenes (BTEX) and methyl tertiary butyl ether (MTBE) by U.S. EPA Method 8260; total petroleum hydrocarbons quantified as gas (TPHg), diesel (TPHd), and motor oil (TPHmo) by U.S. EPA Method 8015M; and polynuclear aromatic hydrocarbons (PAHs) by U.S. EPA Method 8270 SIM.

[2] Monitoring wells SRMW-05 and SRMW-06 are located west of the site on the Salvador Trust property, SRMW-07 and SRMW-08 are located east of the site on property owned by the NWPRA, and well MW-10 is located on the site.

[3] NA = not analyzed.

[4] "<" = not detected above the laboratory detection limit shown.

[5] "U" indicates compound was positively identified; the associated numerical value is less than five times the concentration detected in the field equipment blank and the result is considered non-detect.

[6] "<0.5/<0.5" = primary sample/duplicate sample

Notes:

1 Samples collected by Geomatrix Consultants, Inc. Samples collected in March 2000 were analyzed by Entech Analytical, Inc. of Sunnyvale, California. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd., of Berkeley, California.

2 Sampling depth in feet below ground surface. Depth listed represents the bottom depth of the sample interval (i.e. 1.0 equals a six inch sample collected from 0.5 – 1.0 feet below ground surface).

3 TPHd = total petroleum hydrocarbons as diesel; TPHmo = total petroleum hydrocarbons as motor oil. Samples analyzed by EPA Method 8015M followed by a silica gel cleanup by EPA Method 3630C.

4 WET = waste extraction test, waste extraction test was performed using simulated rainwater. Results are presented in micrograms per liter.

5 PNAs = polynuclear aromatic compounds. In March 2000, samples were analyzed by EPA Method 8270 SIM. In September 2000, samples were analyzed by EPA Method 8270.

6 The leachability tests for TPH and PNAs from samples SRB-36 and SRB-32, respectively, were performed one day beyond their hold times.

7 Lab sheet indicates that result is quantified as diesel but the chromatographic pattern is not typical of fuel.

8 1,300/<50 = result without silica gel cleanup / result with silica gel cleanup. The silica gel cleanup method removes non-hydrocarbons that would otherwise interfere with measurement of petroleum hydrocarbons. The data generated following silica gel cleanup is used for analysis of the leachability test results.

-- = not analyzed

Notes:

[1] Samples were collected by Geomatrix Consultants, Inc. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California; TPHd and TPHmo were analyzed using EPA Method 8015 following silica gel cleanup procedure EPA Method 3630C and VOCs were analyzed for using EPA Method 8240. Samples collected in March 2000 were analyzed by Entech Analytical, Inc. of Sunnyvale, California, and analyzed for TPHd and TPHmo using EPA Method 8015M following silica gel cleanup procedure per Method 3630C; PNAs using Method 8270SIM; and VOCs including MTBE and other fuel oxygenates using EPA Method 8260. Samples that were collected in March 2000 for TPHd, TPHmo, and PAHs were analyzed before and after passing through a 0.7 micron glass fiber filter. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd. of Berkeley, California, for TPHd and TPHm using EPA Method 8015M following silica gel cleanup procedure by EPA Method 3630M; for BTEX and MTBE using EPA Method 8260B; and for PAHs using EPA Method 8270C. Samples collected in September 2001 were analyzed by Severn Trent Laboratories (STL), of Sacramento, California, for TPHg, TPHd, TPHmo by EPA Method 8015M and for MTBE by EPA Method 8260B. Samples collected in 2002 analyzed by STL San Francisco of Pleasanton, California and analyzed for TPHg, TPHd, and TPHmo by EPA Method 8015M following a silica gel cleanup by EPA Method 3630 and for BTEX and MTBE by EPA Method 8260B.

[2] Results of sample/blind duplicate sample (labeled SRB46) are shown.

[3] Lab sheet indicates that result is quantified as diesel; chromatographic pattern not typical of fuel.

[4] A borehole identification number followed by "D" indicates that a blind duplicate sample was collected at this location.

[5] Detection limit for benzene, toluene, and ethylbenzene is 0.5 µg/l. Detection limit for xylenes is 1 µg/l.

[6] Samples were reanalyzed to quantify the dissolved concentrations of the chemicals listed. Analyses were performed by Friedman and Bruya, Inc., of Seattle, WA. Samples were passed through a 0.7 micron glass fiber filter and analyzed according to EPA method 8015M following silica gel cleanup procedure by EPA Method 3630. Extraction and reanalysis of samples SRB-44 and SRB-48 was performed on October 17, and 24, 2000, respectively.

Abbreviations:

TPHg = total petroleum hydrocarbons quantified as gasoline
TPHd = total petroleum hydrocarbons quantified as diesel
TPHmo = total petroleum hydrocarbons quantified as motor oil
f = filtered with 0.7 micron glass fiber filter
PAHs = polynuclear aromatic hydrocarbons
NS = not specified
MTBE = methyl tertiary butyl ether
BTEX = benzene, toluene, ethylbenzene, and xylenes
VOCs = volatile organic compounds
ND = not detected above laboratory reporting limits (for VOCs: 5 to 100 µg/l).
-- = not analyzed

(a) µg/l = micrograms per liter.
(b) Total petroleum hydrocarbons as diesel analysis by EPA Method 8015m with silica gel cleanup.
(c) Total petroleum hydrocarbons as motor oil analysis by EPA Method 8015m with silica gel cleanup.
(d) Analyte not detected at, or above, stated laboratory reporting limit.

Results equal to, or greater than, the laboratory reporting limit are presented in **BOLDFACE** to facilitate identification.

Table 7: Summary of Excavation Pit Dewatering Water Sample Analysis – Total Petroleum Hydrocarbons and VOCs

		Analytical Results (µg/l)[a]					
		TPHd[b]		TPHmo[c]		VOCs[d]

Table 3: Summary of Analytical Results of Groundwater Samples

(a) Monitoring well groundwater samples analyzed by Severn Trent Laboratories (STL) San Francisco of Pleasanton, California. Data for samples collected prior to 29 September 2003 are from the *Quarterly Groundwater Monitoring Report – July 2003* produced by Geomatrix Consultants, Inc.
(b) µg/l = Micrograms per liter.
(c) Benzene, toluene, ethylbenzene, and total xylenes analyzed by EPA Method 8260 unless indicated otherwise.
(d) MTBE = Methyl tertiary butyl ether analyzed by EPA Method 8260 unless indicated otherwise.
(e) TPHg = Total petroleum hydrocarbons as gasoline analyzed by EPA Method 8015M.
(f) TPHd = Total petroleum hydrocarbons as diesel analyzed by EPA Method 8015M. Samples collected since 29 September 2003 analyzed with silica gel cleanup.
(g) TPHmo = Total petroleum hydrocarbons as motor oil analyzed by EPA Method 8015M. Samples collected since 29 September 2003 analyzed with silica gel cleanup.
(h) PAHs = Polycyclic aromatic hydrocarbons analyzed by EPA Method 8270 SIM prior to 29 September 2003 and EPA Method 8270C since 29 September 2003. Reported detection limit reflects the highest detection limit for individual PAHs.
(i) NA = Not analyzed.
(j) < = Not detected at or above stated laboratory reporting limit shown.
(k) Laboratory reports that the reporting limit was raised due to reduced sample size.
(l) Laboratory reports that the surrogate recoveries were lower than the quality control limit due to matrix interference, but that the analytical result was confirmed by reanalysis.
(m) Laboratory reports that the surrogate recoveries were lower than the quality control limit due to matrix interference.
(n) According to USEPA National Functional Guidelines, the compound is considered non-detect since the associated numerical value is less than five times the concentration of the compound detected in the field equipment blank.
(o) Sample analyzed using EPA Method 8021B.
(p) ( ) = Duplicate sample.
(q) The relative percent difference between primary and duplicate samples is greater than 30 percent.
(r) Hydrocarbon reported does not match the laboratory standard.
(s) Quantitation of unknown hydrocarbon(s) in sample based on diesel.
(t) Sample was filtered prior to analysis.
(u) Quantitation of unknown hydrocarbon(s) in sample based on motor oil.
(v) Reporting limits raised due to high level of non-target analyte materials.
(w) Surrogate(s) were diluted out.
(x) Sample was extracted out of hold time.

TPH-g = Total Petroleum Hydrocarbons as gasoline.
TPH-d = Total Petroleum Hydrocarbons as diesel.
TPH-mo = Total Petroleum Hydrocarbons as motor oil.
mg/L = milligrams per liter.
AK = Lighter hydrocarbon than diesel.
AS = Heavier hydrocarbon than gasoline contributing to value.

TABLE 1

ANALYTICAL RESULTS FOR TPHd AND TPHm IN SOIL[1]

Santa Rosa Option Property/Third Street
Santa Rosa, California

Results reported in milligrams per kilogram (mg/kg), unless otherwise noted

Borehole	Depth[2]	Date Collected	TPHd	TPHm	TPHd (WET)[3] - µg/l	TPHm (WET)[3] - µg/l
SRB41						
	1.0	3/7/00	<1	**40**	--	--
	4.5	3/7/00	<1	<13	--	--
	7.5	3/7/00	--	--	--	--
	10.5	3/7/00	--	--	--	--

Notes:

1. Samples collected by Geomatrix Consultants, Inc. on November 14 and 15, 1996 and March 6 and 7, 2000. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California. Samples collected in 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California for TPHd and TPHm using EPA Method 8015M following silica gel cleanup procedure per method 3630C.
2. Depth measured in feet below ground surface.
3. Waste extraction test was performed using simulated rainwater; results are reported in micrograms per liter.
4. "c" denotes composite sample.
5. -- = not analyzed.
6. Lab sheet indicates that result is quantified as diesel; chromatographic pattern not typical of fuel.

Abbreviations:

TPHd = total petroleum hydrocarbons quantified as diesel
TPHm = total petroleum hydrocarbons quantified as motor oil
WET = waste extraction test

Notes:

1. Samples collected by Geomatrix Consultants, Inc. on November 14 and 15, 1996 and March 6 and 7, 2000. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California. Samples collected in 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California.
2. "c" denotes composite sample.
3. -- = Sample not analyzed for this metal.
4. Industrial Preliminary Remediation Goals (PRGs) from U.S. EPA Region 9 (U.S. EPA 1999).
5. The industrial PRG for arsenic at cancer risk levels of $1x10^{-6}$ to $1x10^{-4}$ ranges between 3.0 mg/kg and 300 mg/kg, respectively. At $1x10^{-6}$ cancer risk, the PRG is less than background and therefore is not applicable.
6. The industrial PRG for chromium (III) is used, as speciation of chromium in borings SRB 33-A, SRB 33-B, SRB-34A, and SRB 34-B did not indicate the presence of chromium (VI).
7. PRGs were not available for these constituents. Surrogate PRGs for a constituent with similar physical and chemical properties were used for the PRG comparison.
8. STLC = Soluble Threshold Limit Concentration, California Code of Regulations, Title 22, Section 66216.24
9. TTLC = Total Threshold Limit Concentration, California Code of Regulations, Title 22, Section 66216.24

				Ethylbenzene	0.005	0.054
				Total Xylenes	0.005	0.076
				MTBE	0.02	<0.02

Notes:

1. Analytical methods were as follows:
   Lead - United State Environmental Protection Agency (EPA) Method 6010;
   Benzene, toluene, ethylbenzene, total xylenes, and MTBE - EPA Method 8021.
2. Lead results in "bold" type are those that exceed the site-specific background concentration of 65 mg/kg.
3. MTBE = Methyl tert-butyl ether.
4. MTBE concentration confirmed by EPA Method 8260.
5. < = less than reported detection limit.

Notes:

[1] Samples collected by Geomatrix Consultants, Inc. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California. Samples collected in 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California. Metals analyzed in accordance with U.S. EPA Methods 6000/7000 series.

[2] Sampling depth measured in feet below ground surface. Depth listed represents the bottom depth of the sample interval (i.e. 4 equals a six inch sample collected from 3.5 - 4.0 feet below ground surface).

[3] "c" denotes composite sample.

[4] -- = Sample not analyzed for this metal.

[5] Residential and Industrial Preliminary Remediation Goals (PRGs) from U.S. EPA Region 9 (U.S. EPA 2000).

[6] The residential and industrial PRGs for arsenic at cancer risk levels of $1x10^{-6}$ to $1x10^{-4}$ range between 0.39 mg/kg and 39 mg/kg (residential), and 2.7 and 270 mg/kg (industrial), respectively. At $1x10^{-6}$ cancer risk, the PRG is less than background and therefore is not applicable.

[7] The industrial PRG for chromium (III) is used, as speciation of chromium in borings SRB 33-A, SRB 33-B, SRB-34A, and SRB 34-B did not indicate the presence of chromium (VI).

[8] STLC = Soluble Threshold Limit Concentration, California Code of Regulations, Title 22, Section 66216.24

[9] TTLC = Total Threshold Limit Concentration, California Code of Regulations, Title 22, Section 66216.24

Notes:

[1] Samples were collected by Geomatrix Consultants, Inc. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California for, TPHd and TPHmo using EPA Method 8015. Samples collected in March 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California, for TPHd and TPHmo using EPA Method 8015M following silica gel cleanup procedure by EPA Method 3630C. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd. of Berkeley, California for, TPHd and TPHmo using EPA Method 8015M following silica gel cleanup procedure by EPA Method 3630C. Samples collected in September 2001 were analyzed by Severn Trent Laboratories (STL) of Sacramento, California for TPHg, TPHd, and TPHmo using EPA Method 8015M. Samples collected in 2002 were analyzed by STL San Francisco of Pleasanton, California, for TPHg, TPHd, TPHmo, and Bunker-C fuel oil using EPA Method 8015M following silica gel cleanup procedures by EPA Method 3630C. Samples collected in November 2002 analyzed by Friedman and Bruya, Inc. of Seattle, Washington for TPHd and TPHmo using EPA Method 8015M following silica gel cleanup procedures by EPA Method 3630C.

[2] Sampling depth measured in feet below ground surface. Depth listed represents the bottom depth of the sample (i.e., 4 equals a six inch sample collected from 3.5 - 4.0 feet below ground surface).

[3] "c" denotes composite sample.

[4] -- = not analyzed.

[5] Lab sheet indicates that result is quantified as diesel; chromatographic pattern not typical of fuel.

[6] Additional analyses, total purgeable/total extractable petroleum hydrocarbons, performed for SRB-56-1.0, SRB-62-1.5, SRB-62-6.0. Results were SRB-62-1.0 = 330/8200; SRB-62-1.5 = <1.1/25, and SRB-62-6.0 = <1.2/97, respectively.

[7] 10/6.8 = Result without silica gel cleanup/result with silica gel cleanup.

Abbreviations:
TPHg = total petroleum hydrocarbons quantified as gasoline
TPHd = total petroleum hydrocarbons quantified as diesel
TPHmo = total petroleum hydrocarbons quantified as motor oil

TABLE 7

ANALYTICAL RESULTS FOR POLYNUCLEAR AROMATIC HYDROCARBONS (PAHs) IN SOIL[1]

Santa Rosa Station Phased Closing Property
Santa Rosa, California

Notes:

[1] All samples collected by Geomatrix Consultants, Inc. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California using EPA Method 8310. Samples collected in March 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California using EPA Method 8270SIM. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd., of Berkeley, California, using EPA Method 8270. Samples collected in 2002 analyzed by Severn Trent Laboratories (STL) San Francisco of Pleasanton, California using EPA Method 8270C SIM.

[2] Sample depth measured in feet below ground surface. Depth listed represents the bottom depth of the sample interval (i.e. 4 equals a six inch sample collected from 3.5 - 4.0 feet below ground surface).

[3] "c" denotes composite sample.

[4] -- = not analyzed.

[5] For carcinogenic PAHs (benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(a)pyrene, indeno-(1,2,3-cd)pyrene, and dibenzo(a,h)anthracene) California cancer slope factors were used to derive residential and industrial PRGs. For non-carcinogenic PAHs EPA Region 9 (EPA, 2002) PRGs are presented.

[6] Surrogate PRGs for a constituent with similar physical and chemical properties were used for the PRG comparison. Phenanthrene screening based screening based on fluorene as a surrogate, benzo(g,h,i) perylene screening based on fluoranthene as surrogate.

[7] Soil screening levels are from the EPA PRG document, and assume a dilution attenuation factor (DAF) of 1 and a DAF of 20.

Abbreviations:

PNAs = polynuclear aromatic hydrocarbons
PRGs = preliminary remediation goals
DAF = dilution attentuaion factor

Notes:

[1] All samples were collected by Geomatrix Consultants, Inc. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd. of Berkeley, California for benzene, toluene, ethylbenzene, and xylenes (BTEX) using EPA Method 8260B. Samples collected in September 2001 were analyzed by Severn Trent Laboratories (STL) of Sacramento, California, for MTBE using EPA Method 8260B. Samples analyzed for MTBE were collected in Encore Samplers and prepared for analysis by the laboratory in accordance with EPA Method 5035. Samples collected in 2002 were analyzed by STL San Francisco of Pleasanton, California using EPA MEthod 8260B. Samples analyzed for BTEX and MTBE were collected in Encore Samplers and prepared for analysis by the laboratory in accordance with EPA Method 5035.

[2] Sampling depth in feet below ground surface. Depth listed represents the bottom depth of the sample interval (i.e. 4 equals a six inch sample collected from 3.5 - 4.0 feet below ground surface).

[3] -- = not analyzed

[4] Sample intervals for samples collected in the pipeline area represent depth below pipeline.

Abbreviations:
MTBE = methyl tertiary butyl ether
PRGs = preliminary remediation goals
DAF = dilution attenuation factor
NA = not available

Notes:

1 Samples collected by Geomatrix Consultants, Inc. Samples collected in March 2000 were analyzed by Entech Analytical, Inc. of Sunnyvale, California. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd., of Berkeley, California.

2 Sampling depth in feet below ground surface. Depth listed represents the bottom depth of the sample interval (i.e. 1.0 equals a six inch sample collected from 0.5 – 1.0 feet below ground surface).

3 TPHd = total petroleum hydrocarbons as diesel; TPHmo = total petroleum hydrocarbons as motor oil. Samples analyzed by EPA Method 8015M followed by a silica gel cleanup by EPA Method 3630C.

4 WET = waste extraction test, waste extraction test was performed using simulated rainwater. Results are presented in micrograms per liter.

5 PNAs = polynuclear aromatic compounds. In March 2000, samples were analyzed by EPA Method 8270 SIM. In September 2000, samples were analyzed by EPA Method 8270.

6 The leachability tests for TPH and PNAs from samples SRB-36 and SRB-32, respectively, were performed one day beyond their hold times.

7 Lab sheet indicates that result is quantified as diesel but the chromatographic pattern is not typical of fuel.

8 1,300/<50 = result without silica gel cleanup / result with silica gel cleanup. The silica gel cleanup method removes non-hydrocarbons that would otherwise interfere with measurement of petroleum hydrocarbons. The data generated following silica gel cleanup is used for analysis of the leachability test results.

-- = not analyzed

(c) mg/kg = milligrams per kilogram.
(d) feet bgs = feet below ground surface.
(e) C = Sample collected at the direction of regulatory agency personnel.
(f) < = Analyte not detected at or above stated laboratory reporting limit.

(a) mg/kg = milligrams per kilogram.
(b) feet bgs = feet below ground surface.
(c) TPHd = Total petroleum hydrocarbons as diesel analysis by EPA Method 8015m with silica gel cleanup.
(d) TPHmo = Total petroleum hydrocarbons as motor oil analysis by EPA Method 8015m with silica gel cleanup.
(e) < = Analyte not detected at or above stated laboratory reporting limit.
(f) Sample collected at the direction of regulatory agency personnel.

Results equal to, or greater than, laboratory reporting limit are presented in **BOLDFACE** to facilitate identification.

Quarterly Monitoring Report - Third Quarter 2013

Union Pacific Railroad
2 Fourth Street and 34 Sixth Street, Santa Rosa, California
North Coast Regional Water Quality Control Board
Case No. 1TSR196

1.0 INTRODUCTION

On behalf of Union Pacific Railroad (UPRR), Antea®Group has prepared this *Quarterly Monitoring Report – Third Quarter 2013* for the referenced site located at 2 Fourth Street and 34 Sixth Street in Santa Rosa, California (**Figure 1**). The site is currently owned by Sonoma Marin Area Rail Transit (SMART) and is used as an equipment and supply storage area for SMART construction activities taking place off site. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the "3 West Third Street and 60 West Sixth Street Warehouses", to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties (**Figure 2**). For a summary of the site's background and a history of previous environmental investigations that have been conducted at the subject site, refer to **Appendix A**.

The current well network consists of four groundwater monitoring wells (MW-1 through MW-4) that were installed at the site in May 2013. This report summarizes the data obtained from the third quarter 2013 groundwater monitoring event completed on August 30, 2013. Included herein are groundwater flow contours and trends, contaminant concentration maps, and historical data tables. This report has received a technical review by Ms. Lia Holden, California Professional Geologist #8584.

1.1 Work Performed in the Third Quarter 2013

1. Antea Group prepared and submitted the *Well Abandonment and Site Investigation Report* to the North Coast Regional Water Quality Board (NCRWQCB) on July 26, 2013.
2. Antea Group's subcontractor Blaine Tech Services, Inc. (Blaine Tech) conducted quarterly groundwater gauging and sampling activities on August 30, 2013.

1.2 Work Proposed for the Fourth Quarter 2013

1. Antea Group will submit the *Quarterly Monitoring Report – Third Quarter 2013* to the NCRWQCB (contained herein).
2. Blaine Tech will conduct the fourth quarterly groundwater sampling event in November 2013.

2.0 CURRENT PROJECT STATUS

Current phase of project:	Quarterly Groundwater Monitoring
Lead agency for cleanup oversight:	North Coast Regional Water Quality Control Board (Case No. 1TSR196)
Monitoring well gauging and sampling schedule:	Quarterly: MW-1, MW-2, MW-3, and MW-4
Total number of monitoring wells (**Table 1**):	Onsite: 4 wells (MW-1, MW-2, MW-3, MW-4)
Range of well depths (total depth below ground surface, bgs):	18.5 to 20.0 feet bgs
Historical depth to water range, in feet below top of casing (BTOC):	Min: 9.90 (MW-4, 5/29/13) Max: 14.94 (MW-1, 8/30/13)
Historical groundwater elevation range (ft):	Min: 136.92 (MW-1, 8/30/13) Max: 142.07 (MW-4, 5/29/13)

2.1 Regulatory Correspondence

On June 11, 2013, the NCRWQCB sent a letter approving the destruction of monitoring well SRMW-07 per Antea Group's April 24, 2013 *Well Abandonment Work Plan*. No other correspondence was exchanged during the third quarter 2013.

2.2 Groundwater Monitoring

For this groundwater monitoring event, all four onsite monitoring wells were gauged, purged, and sampled by subcontractor Blaine Tech per standard sampling protocol (**Appendix B**). Copies of Blaine Tech's field data sheets are included in **Appendix C**. The recent gauging and sampling data are summarized below.

Well gauging and sampling date:	August 30, 2013
Wells gauged:	MW-1, MW-2, MW-3 and MW-4
Wells sampled:	MW-1, MW-2, MW-3 and MW-4
Purge method:	Peristaltic pump
Sample collection method:	Dedicated equipment (tubing)
Groundwater parameters measured (**Appendix C; Table 2**):	Depth to water, temperature, pH, conductivity, oxidation-reduction potential (ORP), turbidity, and dissolved oxygen (DO)
Current depth to water range of wells (ft BTOC):	Min: 10.40 (MW-4) Max: 14.94 (MW-1)
Current groundwater elevation range of wells (ft):	Min: 136.92 (MW-1) Max: 141.66 (MW-3)
Groundwater flow direction and gradient:	West-northwest with an average gradient of 0.035 feet per foot (ft/ft)

2.2.1 Groundwater Flow Gradient and Directional Trends

Using the well gauging data from August 30, 2013 and the surveyed well casing elevations (**Table 1**), Antea Group calculated the groundwater table elevation at each monitoring well location (**Table 3**). These elevations were used to calculate and plot the groundwater flow direction and gradient across the site (**Figure 3**).

Based on the third quarter 2013 data, the groundwater flow direction at the site is to the west-northwest with an average hydraulic gradient of 0.035 ft/ft. The groundwater flow during the third quarter 2013 is similar to the first sampling event that occurred in May 2013. In historic reports, groundwater elevation contours prepared with the site's former (larger) well network showed somewhat variable localized flow patterns across the site with an overall flow toward the west-southwest, which is more directly toward Santa Rosa Creek. **Appendix D** includes flow and gradient data from both monitoring events tabulated and plotted on a rose diagram.

2.2.2 Groundwater Quality Data and Contaminant Trends

Groundwater samples collected during the third quarter 2013 sampling event were submitted under chain of custody protocol to TestAmerica Laboratories, Inc. (TestAmerica), a state of California certified laboratory (California Certification No. 2496). The submitted groundwater samples were analyzed for the following:

- Diesel range organics (DRO) by Environmental Protection Agency (EPA) Method 8015 with and without silica gel cleanup,
- Motor oil range organics (MORO) by EPA Method 8015 with and without silica gel cleanup, and
- Polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270C SIM.

The complete laboratory analytical report is included in **Appendix E**. Groundwater analytical results are presented in **Table 3** (current) and **Table 4** (historical); a Groundwater Concentration Map is presented as **Figure 4**.

The laboratory reported one contaminant above the laboratory reporting limit (LRL). DRO was detected in monitoring well MW-4 without silica gel cleanup at a concentration of 150 µg/L; however, the concentration was not detected in the silica gel cleanup analysis, indicating that the DRO detection may be attributed to heavily weathered residual hydrocarbons or naturally occurring carbon from organic material decomposition.

2.2.4 Waste Disposal Summary

Well purge water generated during the third quarter 2013 sampling event was contained in a single Department of Transportation (DOT) approved 55-gallon drum. The drum is currently 1/4 full, labeled and safely stored at the site for use during the fourth quarter 2013 sampling event.

2.2.5 Quality Assurance / Quality Control (QA/QC)

QA/QC measures included use of a field duplicate sample and a detailed QA/QC data validation check on the TestAmerica laboratory analytical results for the August 2013 sampling event performed by Conestoga-Rovers and

Associates (CRA). The TestAmerica laboratory report and CRA validation is included as **Appendix E**. A summary of QA/QC information follows.

Duplicate (WG-2344-DUP1-300813):	The RPDs associated with the field duplicate samples were within acceptable ranges (See laboratory validation report in **Appendix E**)
Laboratory QA/QC Performed:	Yes (memo provided by CRA)
Laboratory Data Qualifiers:	No data qualifiers were indicated in the laboratory report.
Are the data valid for their intended purpose?	Yes, the data are valid

After review of the laboratory validation provided by CRA, Antea Group concludes that the laboratory data obtained during this groundwater sampling event are valid for their intended purpose.

3.0 CONCLUSIONS AND RECOMMENDATIONS

The four recently installed monitoring wells were sampled during the third quarter 2013 monitoring event. The only detection in groundwater was DRO (without silica gel cleanup) in monitoring well MW-4. The sample analyzed using silica gel cleanup was below the LRL. An evaluation of current analytical data indicates minimal hydrocarbon impact in groundwater and that the site conditions are comparable to those known at the time of the site's 2007 case closure.

One year of groundwater monitoring was proposed for the site. The third quarter 2013 sampling event marks the second consecutive sampling event.

Quarterly groundwater monitoring will continue at the site with a fourth quarter 2013 sampling event scheduled for November 2013. If conditions continue to remain stable following two additional monitoring events, Antea Group will request that the NCRWQCB consider the site for environmental case closure.

4.0 LIMITATIONS

The findings contained in this report represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. For any reports cited that were not generated by Antea USA, Inc., the data from those reports are used "as is" and is assumed to be accurate. Antea USA, Inc. does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. This report is based upon a specific scope of work requested by the client. The Contract between Antea Group and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea Group's Client and anyone else specifically listed on this report. Appendix A

Site Details and Summary of Previous Environmental Investigations

SITE DETAILS

Currently, the site is being used as a construction equipment supply storage area for Sonoma Marin Area Rail Transit (SMART) construction activities taking place off site. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the 3 West Third Street and 60 West Sixth Street Warehouses, to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties.

There are currently four groundwater monitoring wells (MW-1 through MW-4) at the site; quarterly groundwater sampling and monitoring is underway.

PREVIOUS INVESTIGATION AND SITE HISTORY SUMMARY

Over the history of environmental activities at the site, laboratories and consultants have used a wide variety of terms for petroleum hydrocarbons reported in analysis of soil and water. Soil and groundwater samples are analyzed typically by Environmental Protection Agency (EPA) method 8015B or 8260B. Antea Group uses the designation GRO for total petroleum hydrocarbons as gasoline within the C_5 to C_{10} carbon range, DRO for total petroleum hydrocarbons as diesel within the C_{10} to C_{28} carbon range, and RRO for total petroleum hydrocarbons as residual range organics (oil) within the C_{24} to C_{40} carbon range.

Terms from previous reports may include total recoverable petroleum hydrocarbons (TRPH), total purgeable petroleum hydrocarbons (TPPH) for GRO, total extractable petroleum hydrocarbons (TEPH) for DRO, and total volatile hydrocarbon (TVH) which refers to a broad carbon range. More specific historical terms are total petroleum hydrocarbons as gasoline (TPHg or TPH-G), total petroleum hydrocarbons as diesel (TPHd or TPH-D), and total petroleum hydrocarbons as oil or motor oil (TPHo, TPHmo, TPH-O, or TPH-MO). The designations are generally comparable to GRO, DRO, and RRO. Antea Group has left the original designation when summarizing historic data and the current designations when applied to recent investigations and summary discussions.

SITE HISTORY

In December 1987, Canonie Environmental Services Corporation (Canonie) removed three USTs from the site. These included a 230-gallon fuel oil UST, a 10,000-gallon diesel UST, and a 10,000-gallon gasoline UST, which were located within and northwest of the existing fenced enclosure. During UST removal activities, no holes or signs of leakage or overfilling were noted for any of the tanks. TPH were not detected above laboratory reporting limits in the soil samples collected from beneath the USTs (Industrial Compliance [IC], 1992).

In April 1990, the North Coast Regional Water Quality Control Board (RWQCB) drilled four borings in the western portion of the property and installed monitoring wells in two of the borings (MW-2 and MW-3). Monitoring well MW-3 was located approximately 100 feet down gradient (to the southwest) of the former fuel oil UST. Based on

information presented in a July 1992 report by IC, analytical results for samples collected from the RWQCB borings showed that no petroleum hydrocarbons were present in soil samples collected from soil boring B-1. However, oil and grease was present in the soil sample collected from boring B-1 at 12 feet bgs at a concentration of 200 milligrams per kilogram (mg/kg). Additionally, this sample contained low concentrations of polynuclear aromatic hydrocarbons (PAHs). Soil samples collected at depths of 6 and 16 feet below ground surface (bgs) from soil boring MW-3 contained petroleum hydrocarbons quantified as diesel (TPHd) at concentrations of 11 and 30 mg/kg, respectively. No petroleum hydrocarbons were detected in the groundwater sample collected by the RWQCB from monitoring well MW-2; TPHd was detected at a concentration of 0.4 milligrams per liter (mg/l) in the groundwater sample collected at monitoring well MW-3 (Geomatrix Consultants, Inc. [Geomatrix], 2000).

Soil and grab groundwater samples were collected from five borings located near the former UST area by IC in 1992. No detectable concentrations of petroleum hydrocarbons, benzene, toluene, ethylbenzene, or xylenes (BTEX compounds), or PAHs were reported in any of the soil samples collected. Grab groundwater samples collected from the location of the former diesel and gasoline USTs did not contain petroleum hydrocarbons or BTEX above laboratory reporting limits. The grab groundwater sample collected from the former fuel oil tank location reportedly contained TPHd at concentrations of 31 mg/l; no gasoline or BTEX compounds were detected in the grab groundwater sample collected from IC-B6 (Geomatrix, 2000).

The RWQCB destroyed monitoring wells MW-2 and MW-3 in June 1995. In November 1996, Geomatrix performed an investigation of soil and groundwater at the site to evaluate potential significant environmental impacts resulting from historical features or features identified during previous investigations and to respond to a request by the RWQCB to perform additional characterization in the vicinity of the former underground fuel oil tank. Twelve borings (SRB20 through SRB31) were drilled and samples were analyzed for TPHd, total petroleum hydrocarbons quantified as motor oil (TPHmo), PAHs, metals, and volatile organic compounds (VOCs). Soil samples collected for analyses of TPHd, PAHs, and metals were composited vertically from each boring; discrete samples subsequently were analyzed if elevated concentrations of constituents were detected. Only discrete samples were analyzed for VOCs. Petroleum hydrocarbons were detected in soil at elevated concentrations in boring SRB20 and SRB21, however the presence of petroleum hydrocarbons at these locations decreased with depth. Specifically, the shallower composite sample from SRB20 contained TPHmo at a concentration of 900 mg/kg. Discrete samples from depths of 4.0 and 6.5 feet contained TPHmo at concentrations of 69 mg/kg and less than 5 mg/kg, respectively. No TPHd was detected in soil samples from boring SRB20. In SRB21, TPHmo was present at a concentration of 510 mg/kg in the shallow composite sample; no TPHmo was detected in deeper, discrete samples from this boring. Shallow composite and deeper discrete soil samples from boring SRB21 contained TPHd, at a maximum concentration of 1,600 mg/kg. The concentration of TPHd in this boring decreased with depth and was not detected in the sample collected from 13.5 feet bgs (Geomatrix, 2000).

PAHs were detected in soil at concentrations below 1996 EPA screening criteria for industrial exposure. Concentrations of PAHs detected at this time are also below current PRGs (USEPA, 1999). For example, the maximum detected concentration of benzo(a)pyrene was 0.026 mg/kg in the discrete sample collected from a

depth of 12.5 feet bgs in boring SRB22; the current PRG for benzo(a)pyrene is 0.29 mg/kg. The highest PAH concentration detected was in the discrete soil sample collected from a depth of 7 feet bgs in boring SRB22. In this sample, flourene was detected at a concentration of 0.87 mg/kg; the PRG for flourene is 33,000 mg/kg. Metals concentrations in soil were within expected background concentrations and less than 10 times the soluble threshold limit concentration (STLC)4 in all of the soil samples (discrete and composite). Concentrations of metals in soil samples also were below industrial PRGs. No TPHd, TPHmo, or VOCs were detected in groundwater above laboratory reporting limits. The results of the 1996 sampling program indicated no significant environmental issues at the site. However, based on its review of the results of the November 1996 work, the RWQCB requested that additional issues be addressed before case closure would be considered. These items, which are the focus of the work described herein, include additional evaluation of historical features, potential leachability of petroleum hydrocarbons, and groundwater quality at various site locations (Geomatrix, 2000).

In September 2001, five on-site and off-site groundwater monitoring wells were installed to characterize impacts to groundwater at the project site. A majority of wells were installed in the area of the aforementioned Santa Rosa Woolen Mills facility in the northwest portion of the project site. An up-gradient, single-screen monitoring well was installed on the eastern portion of the property in vicinity of the main line railroad tracks.

Extensive investigative activities were performed in 2002 on the northwest area of the project site at the historical location of the Santa Rosa Woolen Mills Facility. Soil samples collected as part of an investigation within this area reported significant concentrations of petroleum hydrocarbons present in soil and groundwater in the area of the fueling structures, the area of the former above ground fuel storage tank (AST), and the location of a former UST. Impacts to soil were identified as being primarily heavy range petroleum hydrocarbons. From June 2002 to November 2002, an additional characterization was performed in the northwestern area and a fenced enclosure at the property. Soil samples collected from these areas indicated significant concentrations of diesel and motor oil in soil. Proposed remedial options included excavation and removal of accessible impacted soil (EBA, 2008b).

In October and November 2003, approximately 6,500 cubic yards of impacted soil were removed from several areas of the project site. The most significant remediation efforts targeted the northwestern portion of the project site where several areas were excavated to remove impacted soil. Source removal activities began in the area of a former wooden UST that is indicated on historic Sanborn maps for the Santa Rosa Woolen Mills facility. During the excavation activities, remnants of the former UST were found and removed, whereupon the excavation was advanced to a total depth of approximately 18 feet bgs. A significant amount of free-phase petroleum hydrocarbon product was encountered on the groundwater surface during the excavation activities. The product and water was subsequently pumped, treated, and disposed of to the sanitary sewer. The excavation in this area, which resulted in the removal of approximately 700 cubic yards of impacted materials, proceeded to within 20 feet of the existing Sixth Street Warehouse and was subsequently terminated due to concerns of structure stability. Confirmation soil samples indicated that impacted materials containing significant concentrations of diesel and motor oil remained in place in the excavation sidewalls and groundwater in this area (EBA, 2008b).

Excavation activities in the northwestern portion of the property also included the removal off a fuel pipeline. The associated trench was enlarged as it encountered impacted materials in an area designated as the main pit excavation area. A total of 350 cubic yards of impacted materials were removed from this area. The excavation pit extended to depths below first encountered groundwater, which was encountered at approximately 19 feet bgs. The maximum depth attained by the excavation was approximately 22 feet bgs. Impacted groundwater encountered within the excavation pit, which included free-phase petroleum hydrocarbon product, was subsequently removed using pumps, treated, and disposed of to the sanitary sewer (EBA, 2008b).

Additional excavation was also performed on the south side of the aforementioned product line trench in the northwestern area. Approximately 325 cubic yards of impacted soil was removed from this area. Approximately 270 cubic yards of impacted soil was excavated and removed in the southwestern side of the project site identified as the "southern warehouse area" (EBA, 2008b).

Quarterly groundwater monitoring performed in the northwestern portion of the project site property and west into the neighboring property parcel indicated low levels of petroleum hydrocarbons in a monitoring well identified as SRMW-13 located in the northwest corner of the property. In addition, the fuel oxygenate methyl tert-butyl ether (MTBE) was detected in SRMW-8 located on the northeast side of the property. The remaining monitoring wells appear to have been relatively free of impacts during the time monitored (EBA, 2008b).

The RWQCB issued a *No Further Action* (NFA) letter for the previous case at the site on August 31, 2007. In 2008, Sonoma Marin Area Rail Transit District (SMART) granted an option to purchase the site, formerly owned by Northwestern Pacific Railroad Authority (NWRPA) to New Railroad Square Associates, LLC for transit-oriented development purposes. In anticipation of property ownership for the site, New Railroad Square Associates, LLC (with consent from SMART) contracted the services of EBA Engineering (EBA) to perform environmental assessment activities. EBA's November 2008 *Comprehensive Report on Findings* concluded that on-site hazardous materials presently exist at various locations on the property. These materials include an underground oil storage tank (UST), heavy hydrocarbon soil and groundwater impacts in the vicinity of soil boring SB-1, and impacted shallow soil across the site. The RWQCB reopened the environmental case for the site on January 16, 2009 based on EBA's findings.

In a letter dated February 4, 2011, the RWQCB directed UPRR to remove the oil UST on the property due to SMARTs site improvement activities planned for the site. Another letter, dated July 22, 2011, was submitted to UPRR from the RWQCB which directed them to remove "known shallow impacts", soil impacts encountered during property development and removal of impacted soil in the vicinity of SB-1 in addition to the removal of the oil UST. In November 2011, United Pumping Services (UPS) removed the UST as directed. However, during the initial day-lighting activities of the oil UST, an additional 500-gallon UST containing oil was discovered adjacent and west of the known tank. UPS evacuated, cleaned and removed the second UST in conjunction with the known UST. UPS

excavated and disposed of approximately 213.03 tons of impacted soil surrounding the USTs, and pumped approximately 500 gallons of oil impacted groundwater from the excavation. Antea Group collected 16 soil samples and one grab groundwater sample from within the excavation. Based on the distribution of MORO, DRO, VOCs, and PAHs, it appears that a release from the removed USTs only affected the immediate soils surrounding the USTs. Sidewall samples NWB and SWB collected at 15 feet bgs reported concentrations of VOCs and PAHs not found in any other (shallower) samples collected. From the available data, soil VOCs and PAHs impacts appear to be the result of impacted groundwater within the capillary fringe, originating from outside of the excavated area, and not due to a release from the USTs at that location.

In a letter dated January 19, 2012, the RWQCB directed UPRR to address their remaining concerns from their July 22, 2011 directive letter. The remaining concerns included the removal of known shallow impacts and removal of impacted soil in the vicinity of SB-1. In addition, further investigation around the UST tank pit was directed since evidence of discharge was noted during the removal of the UST in November 2011. In April 2012, Antea Group advanced five soil borings (B1 through B5) on the southwestern boundary of the site and seven qualitative borings (B6 through B12) utilizing cone penetration testing (CPT) tip and Ultra-Violet Optical Screening Tool (UVOST) technology around the tank pit area. The borings were advanced to further investigate impacts of the UST removal and determine any contamination near the site boundaries and their origin. Soil samples were collected and submitted for laboratory analysis. Of the detection above the LRLs, only two concentrations are above their San Francisco Bay RWQCB environmental screening levels (ESLs). The DRO concentration in sample B2-11' [240 milligrams per kilogram (mg/kg)] and the concentration of DRO (810 mg/kg) detected in B4-12' exceeded the ESL of 83 mg/kg. Analysis of the UVOST data suggests that the only boring displaying minor indications of hydrocarbon impacts is boring B7 at approximately 5 to 10 feet bgs.

On July 9 through July 13, 2012 UPS and Antea Group conducted soil excavation in the area of former EBA soil boring SB-1. The results of the sidewall and base samples of the excavation in the vicinity of EBA boring SB-1 indicate that only samples from the southwest portion of the excavation exceed commercial/industrial ESLs for DRO and MORO.

On February 26, 2013, the RWQCB directed UPRR to install four monitoring wells on the site to further investigate groundwater impacts on their origin (potentially from off-site sources). Antea Group had proposed this work in their Site Remedial Action and Investigation Report dated October 16, 2012 and the RWQCB concurred. On May 5 and 6, 2013, Antea Group installed four groundwater monitoring wells (MW-1 through MW-4).

SENSITIVE RECEPTORS

Geomatrix performed a well survey in 2000. Domestic and industrial water supply for the site vicinity is provided through the City of Santa Rosa, which purchases water from the Sonoma County Water Agency (SCWA). The SCWA delivers water to the City via the Sonoma County aqueduct. The source of the water is the Russian River, which is

fed by three main upstream reservoirs. The City of Santa Rosa also has eight standby wells to pump groundwater for emergency purposes; these wells currently are not in use (Geomatrix, 2003).

Information provided by the City of Santa Rosa Utilities Department (SRUD) indicates that 50 groundwater wells are located within a half mile of the site. Of these wells, 21 are located within a half mile generally to the north (hydraulically up- and cross-gradient of the site) and 29 are located within a half mile generally to the south (hydraulically down-gradient of the site). Of the 50 wells, only four are located within a one-quarter mile radius, with two wells located approximately up gradient and two approximately down gradient. Based on conversations with SRUD personnel, only two of the residences located within one-half mile from the site are not connected to the City of Santa Rosa water supply. These residences are located at 654 and 658 Dutton Avenue. Uses for the wells are not tracked by SRUD in all cases, but records indicate that the wells within one-quarter mile of the site are used for irrigation and external use (Geomatrix, 2003).

Information about the possible presence of an additional water-producing well located near the site was provided by the RWQCB. This well was not included in the SRUD database. The well is located to the west of the site between the site and Santa Rosa Creek; its actual location has not been field-verified. At this time the well is not in use, and based on a conversation with the site redeveloper, the well will not be used in the future and will be appropriately destroyed (Geomatrix, 2003).

Appendix B

Blaine Tech Services' Groundwater Sampling Procedures

Blaine Tech Services, Inc.
Standard Operating Procedure

LOW-FLOW SAMPLING

1. Calibrate YSI Flow Cell as per manufacturer's specifications. Thoroughly rinse probe and cup between parameters. Calibration order as follows:

    A. pH (use 3-point calibration of 7, 4, 10)
    B. Oxygen Reduction Potential (ORP)
    C. Specific Conductance
    D. Dissolved Oxygen (DO) (calibrate simulating 100% oxygen saturation)

2. Remove dedicated PE tubing from the well or start with new PE tubing cut to the required length.
3. Gently lower the PE tubing into the well, placing the intake at the center of the screened interval. Take care to minimize disturbance to the water column.
4. Attach the PE tubing to the Peristaltic Pump.
5. Direct effluent line into YSI 556 Flow Cell.
6. Set Peristaltic Pump speed at 100 - 500 ml/min.
7. Collect water quality parameter measurements for temperature, pH, conductivity, turbidity, DO and ORP every 3-5 minutes.
8. Monitor drawdown during purging with electronic water level meter. Record water level with each parameter measurement. MAXIMUM DRAWDOWN IS 0.33 FEET.
9. Collect parameter measurements until stability is achieved. Stability is defined as three consecutive measurements where:

Temp	± 1° Celsius
pH	± 0.1
Conductivity	± 3%
Turbidity	± 10% NTU
DO	± 0.3 mg/l
ORP	± 10 Mv

10. Disconnect effluent line from YSI 556 Flow Cell.
11. Sample through effluent line while maintaining constant flow rate.

Number of drum(s) 1/4 full:	—		1			
Number of drum(s) 1/2 full:	—					
Number of drum(s) 3/4 full:	—					
Number of drum(s) full:	10	10	10			
Total drum(s) on site:	10	10	1			
Are the drum(s) properly labeled?	Yes	Yes	YES			
Drum ID & Contents:	Soil Purge H2O	Soil Purge H2O	Purge H2O			

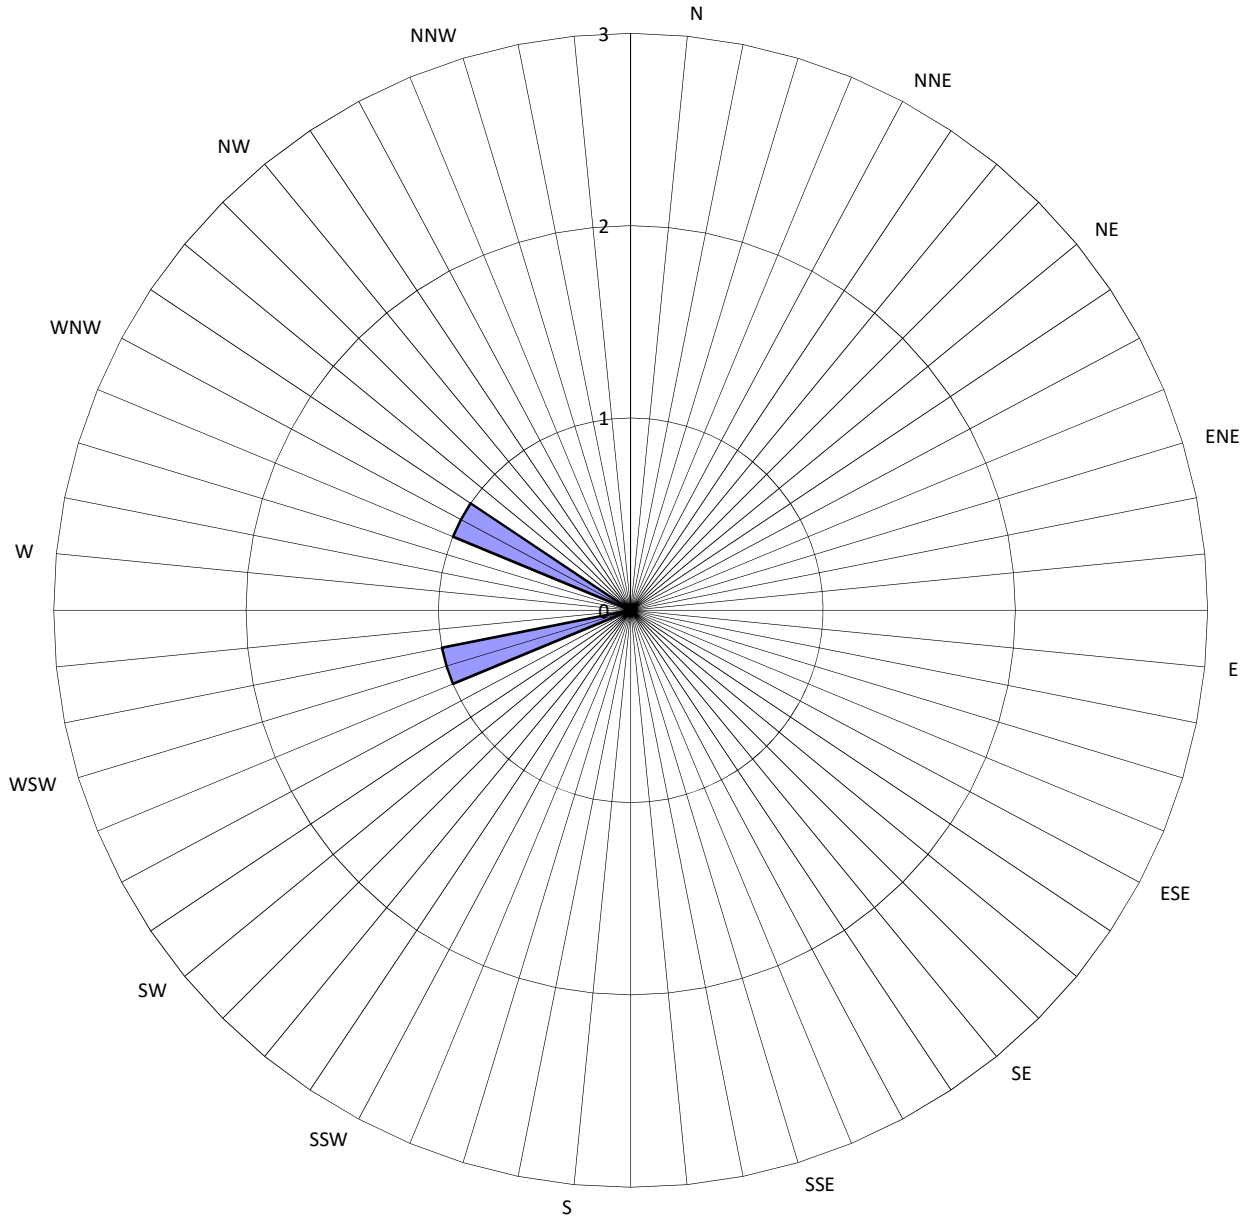
LOCATION OF DRUM(S)

Describe location of drum(s): Next to MW-3

FINAL STATUS

Number of new drum(s) left on site this event	2	0	1			
Date of inspection:	5/21/13	5/29/13	8/30.13			
Drum(s) labelled properly:	Yes	Yes	YES			
Logged by BTS Field Tech:	[signature]	[signature]	CK			
Office reviewed by:	[signature]	[signature]	[signature]			

Appendix D



Historical Groundwater Gradient and Flow Direction Data (Rose Diagram)

GROUNDWATER GRADIENT AND FLOW DIRECTION DATA
UNION PACIFIC RAILROAD
2 FOURTH STREET AND 34 SIXTH STREET
SANTA ROSA, CALIFORNIA

Monitoring Date	Groundwater Flow Direction	Groundwater Gradient (foot per foot)
May-13	West-Southwest	0.031
Aug-13	West-Northwest	0.035
		Average: **0.033**

Notes:
Number of monitoring events = 2
- Data included in this table are from current and historical monitoring reports.

GROUNDWATER FLOW DIRECTION ROSE DIAGRAM
UNION PACIFIC RAILROAD
2 FOURTH STREET AND 34 SIXTH STREET
SANTA ROSA, CALIFORNIA

Legend:
Each concentric gridline represents the number of monitoring events.
The diagram includes data from the Second and Third Quarter 2013.

Groundwater Flow Direction

Appendix E

Certified Laboratory Analytical Report and Lab Validation Memo

TestAmerica

THE LEADER IN ENVIRONMENTAL TESTING

ANALYTICAL REPORT

TestAmerica Laboratories, Inc.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Client: Antea USA, Inc.

Job ID: 720-52065-1

Laboratory: TestAmerica Pleasanton

Narrative

Job Narrative
720-52065-1

Comments
No additional comments.

Receipt
The samples were received on 9/3/2013 6:25 PM; the samples arrived in good condition, properly preserved and, where required, on ice.
The temperature of the cooler at receipt was 2.4º C.

GC/MS Semi VOA
No analytical or quality issues were noted.

GC Semi VOA
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Detection Summary

Client: Antea USA, Inc.
Project/Site: UPRR- Santa Rosa

TestAmerica Job ID: 720-52065-1

Client Sample ID: WG-2344-MW1-300813 — Lab Sample ID: 720-52065-1

No Detections.

Client Sample ID: WG-2344-MW2-300813 — Lab Sample ID: 720-52065-2

No Detections.

Client Sample ID: WG-2344-MW3-300813 — Lab Sample ID: 720-52065-3

No Detections.

Client Sample ID: WG-2344-MW4-300813 — Lab Sample ID: 720-52065-4

Analyte	Result	Qualifier	RL	MDL	Unit	Dil Fac	D	Method	Prep Type
Diesel Range Organics [C10-C28]	150		53		ug/L	1		8015B	Total/NA

Client Sample ID: WG-2344-DUP1-300813 — Lab Sample ID: 720-52065-5

No Detections.

This Detection Summary does not include radiochemical test results.

RE: Data Quality Assessment and Validation of Report J52065
Quarterly Groundwater Sampling
UPRR - 2 Fourth Street and 34 Sixth Street
Santa Rosa California
January 2013

INTRODUCTION

The following document details a reduced validation of analytical data resulting from the August 2013 collection of groundwater samples in Santa Rosa, California. Samples were submitted to Test America Laboratories (TA), located in Pleasanton, California. A sample collection and analysis summary is presented in Table 1. A summary of the analytical methodology is presented in Table 2. The validated analytical results are summarized in Table 3.

Standard Conestoga-Rovers & Associates (CRA) report deliverables were submitted by the laboratory. The final results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the chain of custody form, finished report forms, method blank data, recovery data from surrogate spikes, laboratory control samples (LCS) and field QC samples.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 2 and the document entitled:

i) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", United States Environmental Protection Agency (USEPA) 540/R-99-008, October 1999

These guidelines are collectively referred to as "Guidelines" in this Memorandum.

SAMPLE HOLDING TIME AND PRESERVATION

The sample holding time criteria and sample preservation requirements for the analyses are summarized in Table 2. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All samples were properly preserved and delivered on ice, stored by the laboratory at the required temperature (<6°C).

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

EQUAL EMPLOYMENT OPPORTUNITY EMPLOYER

LABORATORY METHOD BLANK ANALYSES

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures.

For this study, laboratory method blanks were analyzed at a minimum frequency of one per 20 investigative samples and/or one per analytical batch.

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation.

SURROGATE SPIKE RECOVERIES

In accordance with the methods employed, all samples, blanks and QC samples analyzed for semivolatile organic compounds (SVOCs) and diesel range organics/oil range organics (DRO/ORO) are spiked with the appropriate number of surrogate compounds prior to sample extraction. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. All surrogate recoveries met the above criteria.

LABORATORY CONTROL SAMPLE (LCS) ANALYSES

LCS and/or laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS/LCSD were analyzed at a minimum frequency of one per 20 investigative samples and/or one per analytical batch.

Organic Analyses

The LCS/LCSD contained all compounds of interest. All LCS recoveries and relative percent differences were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision.

FIELD QA/QC SAMPLES

The field QA/QC consisted of one field duplicate sample set.

Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, one field duplicate sample was collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 and 100 percent for water and soil samples, respectively. If the reported concentration in either the investigative sample or its duplicate is less than five times the practical quantitation limit (PQL), the evaluation criteria is one time the PQL value for water samples.

All field duplicate results were within acceptable agreement, demonstrating acceptable sampling and analytical precision.

ANALYTE REPORTING

The laboratory did not report any detected concentrations below the laboratory's practical quantitation limit (PQL)/reporting limit (RL).

CONCLUSION

Based on this assessment of the information provided, the data produced by TA were found to exhibit acceptable levels of accuracy and precision and may be used without qualification.

Quarterly Monitoring Report - Fourth Quarter 2013

Union Pacific Railroad
2 Fourth Street and 34 Sixth Street, Santa Rosa, California
North Coast Regional Water Quality Control Board
Case No. 1TSR196

1.0 INTRODUCTION

On behalf of Union Pacific Railroad (UPRR), Antea®Group has prepared this *Quarterly Monitoring Report – Fourth Quarter 2013* for the referenced site located at 2 Fourth Street and 34 Sixth Street in Santa Rosa, California (**Figure 1**). The site is currently owned by Sonoma Marin Area Rail Transit (SMART) and is used as an equipment and supply storage area for SMART construction activities taking place off site. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the "3 West Third Street and 60 West Sixth Street Warehouses", to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties (**Figure 2**). For a summary of the site's background and a history of previous environmental investigations that have been conducted at the subject site, refer to **Appendix A**.

The current well network consists of four groundwater monitoring wells (MW-1 through MW-4) that were installed at the site in May 2013. This report summarizes the data obtained from the fourth quarter 2013 groundwater monitoring event completed on November 20, 2013. Included herein are groundwater flow contours and trends, contaminant concentration maps, and historical data tables. This report has received a technical review by Ms. Lia Holden, California Professional Geologist #8584.

1.1 Work Performed in the Fourth Quarter 2013

1. Antea Group submitted the *Quarterly Monitoring Report – Third Quarter 2013* to the North Coast Regional Water Quality Control Board (NCRWQCB) on October 24, 2013.
2. Antea Group's subcontractor Blaine Tech Services, Inc. (Blaine Tech) conducted quarterly groundwater gauging and sampling activities on November 20, 2013.

1.2 Work Proposed for the First Quarter 2014

1. Antea Group will submit the *Quarterly Monitoring Report – Fourth Quarter 2013* to the NCRWQCB (contained herein).
2. Blaine Tech will conduct the first quarter groundwater sampling event in February 2014.

2.0 CURRENT PROJECT STATUS

Current phase of project:	Quarterly Groundwater Monitoring
Lead agency for cleanup oversight:	North Coast Regional Water Quality Control Board (Case No. 1TSR196)
Monitoring well gauging and sampling schedule:	Quarterly: MW-1, MW-2, MW-3, and MW-4
Total number of monitoring wells (**Table 1**):	Onsite: 4 wells (MW-1, MW-2, MW-3, MW-4)
Range of well depths (total depth below ground surface, bgs):	18.5 to 20.0 feet bgs
Historical depth to water range, in feet below top of casing (BTOC):	Min: 9.90 (MW-4, 5/29/13) Max: 15.53 (MW-1, 11/20/13)
Historical groundwater elevation range (ft):	Min: 136.33 (MW-1, 11/20/13) Max: 142.07 (MW-4, 5/29/13)

2.1 Regulatory Correspondence

No correspondence was exchanged during the fourth quarter 2013.

2.2 Groundwater Monitoring

For this groundwater monitoring event, all four onsite monitoring wells were gauged, purged, and sampled by subcontractor Blaine Tech per standard sampling protocol (**Appendix B**). Copies of Blaine Tech's field data sheets are included in **Appendix C**. The recent gauging and sampling data are summarized below.

Well gauging and sampling date:	November 20, 2013
Wells gauged:	MW-1, MW-2, MW-3 and MW-4
Wells sampled:	MW-1, MW-2, MW-3 and MW-4
Purge method:	Peristaltic pump
Sample collection method:	Dedicated equipment (tubing)
Groundwater parameters measured (**Appendix C; Table 2**):	Depth to water, temperature, pH, conductivity, oxidation-reduction potential (ORP), turbidity, and dissolved oxygen (DO)
Current depth to water range of wells (ft BTOC):	Min: 10.48 (MW-4) Max: 15.53 (MW-1)
Current groundwater elevation range of wells (ft):	Min: 136.33 (MW-1) Max: 141.74 (MW-2)
Groundwater flow direction and gradient:	West-northwest with an average gradient of 0.042 feet per foot (ft/ft)

2.2.1 Groundwater Flow Gradient and Directional Trends

Using the well gauging data from November 20, 2013 and the surveyed well casing elevations (**Table 1**), Antea Group calculated the groundwater table elevation at each monitoring well location (**Table 3**). These elevations were used to calculate and plot the groundwater flow direction and gradient across the site (**Figure 3**).

Based on the fourth quarter 2013 data, the groundwater flow direction at the site is to the west-northwest with an average hydraulic gradient of 0.042 feet per foot (ft/ft). The groundwater flow during the fourth quarter 2013 is

similar to the two previous sampling events, but there appears to be localized variation in the groundwater elevation in the eastern portion of the site. In historic reports, groundwater elevation contours prepared with the site's former (larger) well network showed somewhat variable localized flow patterns across the site with an overall flow toward the west-southwest, which is more directly toward Santa Rosa Creek. **Appendix D** includes flow and gradient data from both monitoring events tabulated and plotted on a rose diagram.

2.2.2 Groundwater Quality Data and Contaminant Trends

Groundwater samples collected during the fourth quarter 2013 sampling event were submitted under chain of custody protocol to TestAmerica Laboratories, Inc. (TestAmerica), a state of California certified laboratory (California Certification No. 2496). The submitted groundwater samples were analyzed for the following:

- Diesel range organics (DRO) by Environmental Protection Agency (EPA) Method 8015 with and without silica gel cleanup,
- Motor oil range organics (MORO) by EPA Method 8015 with and without silica gel cleanup, and
- Polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270C SIM.

The complete laboratory analytical report is included in **Appendix E**. Groundwater analytical results are presented in **Table 3** (current) and **Table 4** (historical); a groundwater concentration map is presented as **Figure 4**.

The laboratory reported four detections above the laboratory reporting limit (LRL). DRO was detected in monitoring wells MW-2 and MW-4 without silica gel cleanup at concentrations of 68 micrograms per liter (µg/L) and 210 µg/L, respectively; MORO was detected in monitoring wells MW-2 and MW-4 at concentrations of 140 µg/L and 110 µg/L, respectively. With silica gel cleanup, DRO and MORO were not reported above the LRL in any of the wells, indicating that the DRO and MORO detections may be attributed to heavily weathered residual hydrocarbons or naturally occurring carbon from organic material decomposition. PAHs were not detected above the LRL in any of the groundwater samples during the fourth quarter 2013 event.

2.2.3 Waste Disposal Summary

Well purge water generated during the fourth quarter 2013 sampling event was contained in a single Department of Transportation (DOT) approved 55-gallon drum and was temporarily stored at the site. Antea Group coordinated drum pickup and removal with subcontractor United Pumping Services; the drum was removed from the site on December 17, 2013. The manifest was not available at the time of report submittal. Antea Group will include the fully executed manifest in the next quarterly monitoring report.

2.2.4 Quality Assurance / Quality Control (QA/QC)

QA/QC measures included use of a field duplicate sample and a detailed QA/QC data validation check on the TestAmerica laboratory analytical results for the November 2013 sampling event performed by Conestoga-Rovers

and Associates (CRA). The TestAmerica laboratory report and CRA validation memo is included as **Appendix E**. A summary of QA/QC information follows.

Duplicate (WG-2344-DUP1-201113) collected at parent sample MW-4:	Contaminant concentrations were not detected above the LRL for both the parent and duplicate sample (See validation memo in **Appendix E**)
Laboratory QA/QC Performed:	Yes (memo provided by CRA)
Laboratory Data Qualifiers:	No data qualifiers were indicated in the laboratory report
Are the data valid for their intended purpose?	Yes, the data are valid

After review of the laboratory validation provided by CRA, Antea Group concludes that the laboratory data obtained during this groundwater sampling event are valid for their intended purpose.

3.0 CONCLUSIONS AND RECOMMENDATIONS

All site monitoring wells were sampled during the fourth quarter 2013 monitoring event. The only detections in groundwater were DRO and MORO (without silica gel cleanup) in monitoring wells MW-2 and MW-4. The samples were also analyzed using silica gel cleanup, and were below the LRL. An evaluation of current analytical data indicates minimal hydrocarbon impact in groundwater and that the site conditions are comparable to those known at the time of the site's 2007 case closure.

One year of groundwater monitoring was proposed for the site. The fourth quarter 2013 sampling event marks the third consecutive sampling event. Quarterly groundwater monitoring will continue at the site with a first quarter 2014 sampling event scheduled for February 2014. If conditions continue to remain stable following the next monitoring event, Antea Group will request that the NCRWQCB consider the site for environmental case closure.

4.0 LIMITATIONS

The findings contained in this report represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. For any reports cited that were not generated by Antea USA, Inc., the data from those reports are used "as is" and is assumed to be accurate. Antea USA, Inc. does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. This report is based upon a specific scope of work requested by the client. The Contract between Antea Group and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea Group's Client and anyone else specifically listed on this report. Antea Group will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea Group makes no express or implied warranty as to the contents of this report.

2 - Analyzed by EPA Method 8270C SIM

Appendix A

Site Details and Summary of Previous Environmental Investigations

SITE DETAILS

Currently, the site is being used as a construction equipment supply storage area for Sonoma Marin Area Rail Transit (SMART) construction activities taking place off site. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the 3 West Third Street and 60 West Sixth Street Warehouses, to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties.

There are currently four groundwater monitoring wells (MW-1 through MW-4) at the site; quarterly groundwater sampling and monitoring is underway.

PREVIOUS INVESTIGATION AND SITE HISTORY SUMMARY

Over the history of environmental activities at the site, laboratories and consultants have used a wide variety of terms for petroleum hydrocarbons reported in analysis of soil and water. Soil and groundwater samples are analyzed typically by Environmental Protection Agency (EPA) method 8015B or 8260B. Antea Group uses the designation GRO for total petroleum hydrocarbons as gasoline within the C_5 to C_{10} carbon range, DRO for total petroleum hydrocarbons as diesel within the C_{10} to C_{28} carbon range, and RRO for total petroleum hydrocarbons as residual range organics (oil) within the C_{24} to C_{40} carbon range.

Terms from previous reports may include total recoverable petroleum hydrocarbons (TRPH), total purgeable petroleum hydrocarbons (TPPH) for GRO, total extractable petroleum hydrocarbons (TEPH) for DRO, and total volatile hydrocarbon (TVH) which refers to a broad carbon range. More specific historical terms are total petroleum hydrocarbons as gasoline (TPHg or TPH-G), total petroleum hydrocarbons as diesel (TPHd or TPH-D), and total petroleum hydrocarbons as oil or motor oil (TPHo, TPHmo, TPH-O, or TPH-MO). The designations are generally comparable to GRO, DRO, and RRO. Antea Group has left the original designation when summarizing historic data and the current designations when applied to recent investigations and summary discussions.

SITE HISTORY

In December 1987, Canonie Environmental Services Corporation (Canonie) removed three USTs from the site. These included a 230-gallon fuel oil UST, a 10,000-gallon diesel UST, and a 10,000-gallon gasoline UST, which were located within and northwest of the existing fenced enclosure. During UST removal activities, no holes or signs of leakage or overfilling were noted for any of the tanks. TPH were not detected above laboratory reporting limits in the soil samples collected from beneath the USTs (Industrial Compliance [IC], 1992).

In April 1990, the North Coast Regional Water Quality Control Board (RWQCB) drilled four borings in the western portion of the property and installed monitoring wells in two of the borings (MW-2 and MW-3). Monitoring well MW-3 was located approximately 100 feet down gradient (to the southwest) of the former fuel oil UST. Based on

information presented in a July 1992 report by IC, analytical results for samples collected from the RWQCB borings showed that no petroleum hydrocarbons were present in soil samples collected from soil boring B-1. However, oil and grease was present in the soil sample collected from boring B-1 at 12 feet bgs at a concentration of 200 milligrams per kilogram (mg/kg). Additionally, this sample contained low concentrations of polynuclear aromatic hydrocarbons (PAHs). Soil samples collected at depths of 6 and 16 feet below ground surface (bgs) from soil boring MW-3 contained petroleum hydrocarbons quantified as diesel (TPHd) at concentrations of 11 and 30 mg/kg, respectively. No petroleum hydrocarbons were detected in the groundwater sample collected by the RWQCB from monitoring well MW-2; TPHd was detected at a concentration of 0.4 milligrams per liter (mg/l) in the groundwater sample collected at monitoring well MW-3 (Geomatrix Consultants, Inc. [Geomatrix], 2000).

Soil and grab groundwater samples were collected from five borings located near the former UST area by IC in 1992. No detectable concentrations of petroleum hydrocarbons, benzene, toluene, ethylbenzene, or xylenes (BTEX compounds), or PAHs were reported in any of the soil samples collected. Grab groundwater samples collected from the location of the former diesel and gasoline USTs did not contain petroleum hydrocarbons or BTEX above laboratory reporting limits. The grab groundwater sample collected from the former fuel oil tank location reportedly contained TPHd at concentrations of 31 mg/l; no gasoline or BTEX compounds were detected in the grab groundwater sample collected from IC-B6 (Geomatrix, 2000).

The RWQCB destroyed monitoring wells MW-2 and MW-3 in June 1995. In November 1996, Geomatrix performed an investigation of soil and groundwater at the site to evaluate potential significant environmental impacts resulting from historical features or features identified during previous investigations and to respond to a request by the RWQCB to perform additional characterization in the vicinity of the former underground fuel oil tank. Twelve borings (SRB20 through SRB31) were drilled and samples were analyzed for TPHd, total petroleum hydrocarbons quantified as motor oil (TPHmo), PAHs, metals, and volatile organic compounds (VOCs). Soil samples collected for analyses of TPHd, PAHs, and metals were composited vertically from each boring; discrete samples subsequently were analyzed if elevated concentrations of constituents were detected. Only discrete samples were analyzed for VOCs. Petroleum hydrocarbons were detected in soil at elevated concentrations in boring SRB20 and SRB21, however the presence of petroleum hydrocarbons at these locations decreased with depth. Specifically, the shallower composite sample from SRB20 contained TPHmo at a concentration of 900 mg/kg. Discrete samples from depths of 4.0 and 6.5 feet contained TPHmo at concentrations of 69 mg/kg and less than 5 mg/kg, respectively. No TPHd was detected in soil samples from boring SRB20. In SRB21, TPHmo was present at a concentration of 510 mg/kg in the shallow composite sample; no TPHmo was detected in deeper, discrete samples from this boring. Shallow composite and deeper discrete soil samples from boring SRB21 contained TPHd, at a maximum concentration of 1,600 mg/kg. The concentration of TPHd in this boring decreased with depth and was not detected in the sample collected from 13.5 feet bgs (Geomatrix, 2000).

PAHs were detected in soil at concentrations below 1996 EPA screening criteria for industrial exposure. Concentrations of PAHs detected at this time are also below current PRGs (USEPA, 1999). For example, the maximum detected concentration of benzo(a)pyrene was 0.026 mg/kg in the discrete sample collected from a

depth of 12.5 feet bgs in boring SRB22; the current PRG for benzo(a)pyrene is 0.29 mg/kg. The highest PAH concentration detected was in the discrete soil sample collected from a depth of 7 feet bgs in boring SRB22. In this sample, flourene was detected at a concentration of 0.87 mg/kg; the PRG for flourene is 33,000 mg/kg. Metals concentrations in soil were within expected background concentrations and less than 10 times the soluble threshold limit concentration (STLC)4 in all of the soil samples (discrete and composite). Concentrations of metals in soil samples also were below industrial PRGs. No TPHd, TPHmo, or VOCs were detected in groundwater above laboratory reporting limits. The results of the 1996 sampling program indicated no significant environmental issues at the site. However, based on its review of the results of the November 1996 work, the RWQCB requested that additional issues be addressed before case closure would be considered. These items, which are the focus of the work described herein, include additional evaluation of historical features, potential leachability of petroleum hydrocarbons, and groundwater quality at various site locations (Geomatrix, 2000).

In September 2001, five on-site and off-site groundwater monitoring wells were installed to characterize impacts to groundwater at the project site. A majority of wells were installed in the area of the aforementioned Santa Rosa Woolen Mills facility in the northwest portion of the project site. An up-gradient, single-screen monitoring well was installed on the eastern portion of the property in vicinity of the main line railroad tracks.

Extensive investigative activities were performed in 2002 on the northwest area of the project site at the historical location of the Santa Rosa Woolen Mills Facility. Soil samples collected as part of an investigation within this area reported significant concentrations of petroleum hydrocarbons present in soil and groundwater in the area of the fueling structures, the area of the former above ground fuel storage tank (AST), and the location of a former UST. Impacts to soil were identified as being primarily heavy range petroleum hydrocarbons. From June 2002 to November 2002, an additional characterization was performed in the northwestern area and a fenced enclosure at the property. Soil samples collected from these areas indicated significant concentrations of diesel and motor oil in soil. Proposed remedial options included excavation and removal of accessible impacted soil (EBA, 2008b).

In October and November 2003, approximately 6,500 cubic yards of impacted soil were removed from several areas of the project site. The most significant remediation efforts targeted the northwestern portion of the project site where several areas were excavated to remove impacted soil. Source removal activities began in the area of a former wooden UST that is indicated on historic Sanborn maps for the Santa Rosa Woolen Mills facility. During the excavation activities, remnants of the former UST were found and removed, whereupon the excavation was advanced to a total depth of approximately 18 feet bgs. A significant amount of free-phase petroleum hydrocarbon product was encountered on the groundwater surface during the excavation activities. The product and water was subsequently pumped, treated, and disposed of to the sanitary sewer. The excavation in this area, which resulted in the removal of approximately 700 cubic yards of impacted materials, proceeded to within 20 feet of the existing Sixth Street Warehouse and was subsequently terminated due to concerns of structure stability. Confirmation soil samples indicated that impacted materials containing significant concentrations of diesel and motor oil remained in place in the excavation sidewalls and groundwater in this area (EBA, 2008b).

Excavation activities in the northwestern portion of the property also included the removal off a fuel pipeline. The associated trench was enlarged as it encountered impacted materials in an area designated as the main pit excavation area. A total of 350 cubic yards of impacted materials were removed from this area. The excavation pit extended to depths below first encountered groundwater, which was encountered at approximately 19 feet bgs. The maximum depth attained by the excavation was approximately 22 feet bgs. Impacted groundwater encountered within the excavation pit, which included free-phase petroleum hydrocarbon product, was subsequently removed using pumps, treated, and disposed of to the sanitary sewer (EBA, 2008b).

Additional excavation was also performed on the south side of the aforementioned product line trench in the northwestern area. Approximately 325 cubic yards of impacted soil was removed from this area. Approximately 270 cubic yards of impacted soil was excavated and removed in the southwestern side of the project site identified as the "southern warehouse area" (EBA, 2008b).

Quarterly groundwater monitoring performed in the northwestern portion of the project site property and west into the neighboring property parcel indicated low levels of petroleum hydrocarbons in a monitoring well identified as SRMW-13 located in the northwest corner of the property. In addition, the fuel oxygenate methyl tert-butyl ether (MTBE) was detected in SRMW-8 located on the northeast side of the property. The remaining monitoring wells appear to have been relatively free of impacts during the time monitored (EBA, 2008b).

The RWQCB issued a *No Further Action* (NFA) letter for the previous case at the site on August 31, 2007. In 2008, Sonoma Marin Area Rail Transit District (SMART) granted an option to purchase the site, formerly owned by Northwestern Pacific Railroad Authority (NWRPA) to New Railroad Square Associates, LLC for transit-oriented development purposes. In anticipation of property ownership for the site, New Railroad Square Associates, LLC (with consent from SMART) contracted the services of EBA Engineering (EBA) to perform environmental assessment activities. EBA's November 2008 *Comprehensive Report on Findings* concluded that on-site hazardous materials presently exist at various locations on the property. These materials include an underground oil storage tank (UST), heavy hydrocarbon soil and groundwater impacts in the vicinity of soil boring SB-1, and impacted shallow soil across the site. The RWQCB reopened the environmental case for the site on January 16, 2009 based on EBA's findings.

In a letter dated February 4, 2011, the RWQCB directed UPRR to remove the oil UST on the property due to SMARTs site improvement activities planned for the site. Another letter, dated July 22, 2011, was submitted to UPRR from the RWQCB which directed them to remove "known shallow impacts", soil impacts encountered during property development and removal of impacted soil in the vicinity of SB-1 in addition to the removal of the oil UST. In November 2011, United Pumping Services (UPS) removed the UST as directed. However, during the initial day-lighting activities of the oil UST, an additional 500-gallon UST containing oil was discovered adjacent and west of the known tank. UPS evacuated, cleaned and removed the second UST in conjunction with the known UST. UPS

excavated and disposed of approximately 213.03 tons of impacted soil surrounding the USTs, and pumped approximately 500 gallons of oil impacted groundwater from the excavation. Antea Group collected 16 soil samples and one grab groundwater sample from within the excavation. Based on the distribution of MORO, DRO, VOCs, and PAHs, it appears that a release from the removed USTs only affected the immediate soils surrounding the USTs. Sidewall samples NWB and SWB collected at 15 feet bgs reported concentrations of VOCs and PAHs not found in any other (shallower) samples collected. From the available data, soil VOCs and PAHs impacts appear to be the result of impacted groundwater within the capillary fringe, originating from outside of the excavated area, and not due to a release from the USTs at that location.

In a letter dated January 19, 2012, the RWQCB directed UPRR to address their remaining concerns from their July 22, 2011 directive letter. The remaining concerns included the removal of known shallow impacts and removal of impacted soil in the vicinity of SB-1. In addition, further investigation around the UST tank pit was directed since evidence of discharge was noted during the removal of the UST in November 2011. In April 2012, Antea Group advanced five soil borings (B1 through B5) on the southwestern boundary of the site and seven qualitative borings (B6 through B12) utilizing cone penetration testing (CPT) tip and Ultra-Violet Optical Screening Tool (UVOST) technology around the tank pit area. The borings were advanced to further investigate impacts of the UST removal and determine any contamination near the site boundaries and their origin. Soil samples were collected and submitted for laboratory analysis. Of the detection above the LRLs, only two concentrations are above their San Francisco Bay RWQCB environmental screening levels (ESLs). The DRO concentration in sample B2-11' [240 milligrams per kilogram (mg/kg)] and the concentration of DRO (810 mg/kg) detected in B4-12' exceeded the ESL of 83 mg/kg. Analysis of the UVOST data suggests that the only boring displaying minor indications of hydrocarbon impacts is boring B7 at approximately 5 to 10 feet bgs.

On July 9 through July 13, 2012 UPS and Antea Group conducted soil excavation in the area of former EBA soil boring SB-1. The results of the sidewall and base samples of the excavation in the vicinity of EBA boring SB-1 indicate that only samples from the southwest portion of the excavation exceed commercial/industrial ESLs for DRO and MORO.

On February 26, 2013, the RWQCB directed UPRR to install four monitoring wells on the site to further investigate groundwater impacts on their origin (potentially from off-site sources). Antea Group had proposed this work in their Site Remedial Action and Investigation Report dated October 16, 2012 and the RWQCB concurred. On May 5 and 6, 2013, Antea Group installed four groundwater monitoring wells (MW-1 through MW-4).

SENSITIVE RECEPTORS

Geomatrix performed a well survey in 2000. Domestic and industrial water supply for the site vicinity is provided through the City of Santa Rosa, which purchases water from the Sonoma County Water Agency (SCWA). The SCWA delivers water to the City via the Sonoma County aqueduct. The source of the water is the Russian River, which is

fed by three main upstream reservoirs. The City of Santa Rosa also has eight standby wells to pump groundwater for emergency purposes; these wells currently are not in use (Geomatrix, 2003).

Information provided by the City of Santa Rosa Utilities Department (SRUD) indicates that 50 groundwater wells are located within a half mile of the site. Of these wells, 21 are located within a half mile generally to the north (hydraulically up- and cross-gradient of the site) and 29 are located within a half mile generally to the south (hydraulically down-gradient of the site). Of the 50 wells, only four are located within a one-quarter mile radius, with two wells located approximately up gradient and two approximately down gradient. Based on conversations with SRUD personnel, only two of the residences located within one-half mile from the site are not connected to the City of Santa Rosa water supply. These residences are located at 654 and 658 Dutton Avenue. Uses for the wells are not tracked by SRUD in all cases, but records indicate that the wells within one-quarter mile of the site are used for irrigation and external use (Geomatrix, 2003).

Information about the possible presence of an additional water-producing well located near the site was provided by the RWQCB. This well was not included in the SRUD database. The well is located to the west of the site between the site and Santa Rosa Creek; its actual location has not been field-verified. At this time the well is not in use, and based on a conversation with the site redeveloper, the well will not be used in the future and will be appropriately destroyed (Geomatrix, 2003).

Appendix B

Blaine Tech Services' Groundwater Sampling Procedures

Blaine Tech Services, Inc.
Standard Operating Procedure

LOW-FLOW SAMPLING

1. Calibrate YSI Flow Cell as per manufacturer's specifications. Thoroughly rinse probe and cup between parameters. Calibration order as follows:

    A. pH (use 3-point calibration of 7, 4, 10)
    B. Oxygen Reduction Potential (ORP)
    C. Specific Conductance
    D. Dissolved Oxygen (DO) (calibrate simulating 100% oxygen saturation)

2. Remove dedicated PE tubing from the well or start with new PE tubing cut to the required length.
3. Gently lower the PE tubing into the well, placing the intake at the center of the screened interval. Take care to minimize disturbance to the water column.
4. Attach the PE tubing to the Peristaltic Pump.
5. Direct effluent line into YSI 556 Flow Cell.
6. Set Peristaltic Pump speed at 100 - 500 ml/min.
7. Collect water quality parameter measurements for temperature, pH, conductivity, turbidity, DO and ORP every 3-5 minutes.
8. Monitor drawdown during purging with electronic water level meter. Record water level with each parameter measurement. MAXIMUM DRAWDOWN IS 0.33 FEET.
9. Collect parameter measurements until stability is achieved. Stability is defined as three consecutive measurements where:

Temp	± 1° Celsius
pH	± 0.1
Conductivity	± 3%
Turbidity	± 10% NTU
DO	± 0.3 mg/l
ORP	± 10 Mv

10. Disconnect effluent line from YSI 556 Flow Cell.
11. Sample through effluent line while maintaining constant flow rate.

SPH or Purge Water Drum Log

Client: Antea

Site Address: UPRR @ Santa Rosa, CA

STATUS OF DRUM(S) UPON ARRIVAL						
Date	5/20/13	5/29/13	8/30/13	11.20.13		
Number of drum(s) empty:	—					
Number of drum(s) 1/4 full:	—					
Number of drum(s) 1/2 full:	—					
Number of drum(s) 3/4 full:	—	1				
Number of drum(s) full:	8	9				
Total drum(s) on site:	8	10	0	1		
Are the drum(s) properly labeled?	Yes	Yes	—	Yes		
Drum ID & Contents:	soil cuttings H2O	soil H2O	—	purge H2O		
If any drum(s) are partially or totally filled, what is the first use date:	5/16/13	5/16/13	—	8.30.13		

- If you add any SPH to an empty or partially filled drum, drum must have at least 20 gals. of Purgewater or DI Water.

-If drum contains SPH, the drum MUST be steel AND labeled with the appropriate label.

-All BTS drums MUST be labeled appropriately.

STATUS OF DRUM(S) UPON DEPARTURE						
Date	5/21/13	5/29/13	8/30/13	11.20.13		
Number of drums empty:	—					
Number of drum(s) 1/4 full:	—		1	1		
Number of drum(s) 1/2 full:	—					
Number of drum(s) 3/4 full:	—					
Number of drum(s) full:	10	10	~~10~~			
Total drum(s) on site:	10	10	1	1		
Are the drum(s) properly labeled?	Yes	Yes	Yes	Yes		
Drum ID & Contents:	soil Purge H2O	soil purge H2O	purge H2O	purge H2O		

LOCATION OF DRUM(S)
Describe location of drum(s): Next to MW-3

FINAL STATUS						
Number of new drum(s) left on site this event	2	0	1	0		
Date of inspection:	5/21/13	5/29/13	8/30/13	11.20.13		
Drum(s) labelled properly:	Yes	Yes	Yes	Yes		
Logged by BTS Field Tech:			CK	BP

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 11/22/2013 10:25 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.5º C.

GC/MS Semi VOA
No analytical or quality issues were noted.

GC Semi VOA
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

RE: Analytical Results and Reduced Validation
Groundwater Monitoring and Sampling
Union Pacific Railroad (UPRR) – Fourth Street and 34 Sixth Street
Santa Rosa, California
November 2013

1.0 Introduction

The following document details a reduced validation of analytical results for groundwater samples collected in support of the Groundwater Monitoring and Sampling at the Fourth Street and 34 Sixth Street Site in Santa Rosa, California during November 2013. Samples were submitted to TestAmerica, located in Pleasanton, California. A sample collection and analysis summary is presented in Table 1. A summary of the analytical methodology is presented in Table 2. The validated analytical results are summarized in Table 3.

Standard Conestoga-Rovers & Associates (CRA) report deliverables were submitted by the laboratory. The final results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the chain of custody forms, finished report forms, method blank data, duplicate data, recovery data from surrogate spikes, laboratory control samples (LCS).

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 3 and applicable guidance from the documents entitled:

i) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", United States Environmental Protection Agency (USEPA) 540/R-08-01, June 2008

This item will subsequently be referred to as the "Guidelines" in this Memorandum.

2.0 Sample Holding Time and Preservation

The sample holding time criteria for the analyses are summarized in Table 2. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

EQUAL EMPLOYMENT OPPORTUNITY EMPLOYER

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (<6°C).

3.0 Laboratory Method Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures.

For this study, laboratory method blanks were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation.

4.0 Surrogate Spike Recoveries - Organic Analyses

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for semi-volatile organic compound (SVOC) analysis were spiked with the appropriate number of surrogate compounds prior to sample extraction and analysis.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against the associated control limits. All surrogate recoveries met the above criteria.

5.0 Laboratory Control Sample Analyses

LCS and/or laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS/LCSD were analyzed at a minimum frequency of 1 per 20 investigative samples and/or 1 per analytical batch.

Organic Analyses

The LCS/LCSD contained all the compounds of interest. All LCS recoveries and RPDs were within the associated control limits, demonstrating acceptable analytical accuracy and precision.

6.0 Field QA/QC Samples

The field QA/QC consisted of one field duplicate sample set.

Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, one field duplicate sample was collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than 50 and 100 percent for water and soil samples, respectively. If the reported concentration in either the investigative sample or its duplicate is less than five times the practical quantitation limit (PQL), the evaluation criteria is one or two times the PQL value for water and soil samples, respectively.

All field duplicate results were within acceptable agreement, demonstrating acceptable sampling and analytical precision.

7.0 Analyte Reporting

The laboratory did not report any detected concentrations below the laboratory's PQL/reporting limit (RL).

8.0 Conclusion

Based on the assessment detailed in the foregoing, the summarized data are acceptable without qualification.

Section 1: Introduction

Kennedy/Jenks Consultants (Kennedy/Jenks) has prepared this *Source Area Removal Report* (Report) on behalf of the Union Pacific Railroad Company (Union Pacific) and the Northwestern Pacific Railroad Authority (NWPRA). The Report documents source area investigation and source area removal actions completed at the Santa Rosa Station (Site) in October and November 2003. Kennedy/Jenks conducted the source area removals along a former underground petroleum pipeline and wooden underground storage tank (UST) in the Northwestern Area, selected areas within the Fenced Enclosure, and selected areas near a Southern Warehouse. Nineteen soil borings were advanced along the eastern boundary of the 6th Street Warehouse in order to conduct a source area investigation. Kennedy/Jenks coordinated the services of the drilling contractor, the construction contractor and laboratory services and worked in cooperation with and at the direction of the North Coast Regional Water Quality Control Board (Regional Board) and the Santa Rosa Fire Department (SRFD) to conduct the source area removals.

The Site is located in Santa Rosa, California between 3rd and 6th Streets, west of Wilson Street, in Railroad Square (Figure 1). The Site is vacant except for the Fenced Enclosure area in the eastern section of the Site (Figure 2). The area surrounding the Site is primarily commercial and residential. As part of the source removal actions, the Site was enclosed with a 6-foot chain link fence with lockable access gates on 3rd Street and 6th Street.

In order to maintain consistency with past investigative reports and the documentation collected during the source removal actions, project north and project south are referring to 6th and 3rd Streets, respectively. Project east is in the direction of the NWPRA right-of-way, and project west is in the direction of the Santa Rosa Creek.

The Site has been used for railroad operations since before 1900. Northwestern Pacific Railroad originally owned the Site and used it as a water and fueling station. Site ownership was transferred to the Southern Pacific Railroad Company (SPTCo) in 1906. Union Pacific purchased SPTCo in 1996, and thus acquired ownership of the Site. Site ownership is to transfer to NWPRA in the near future.

Additional details on the Site, site description and history, and the findings of previous investigations are provided in the *Environmental Site Conditions and Proposed Action Plan* (Geomatrix Consultants, January 2003) and *Limited Source Area Removal and Investigation Work Plan* (Kennedy/Jenks, 8 September 2003).

Section 2: General Investigation and Source Area Removal Information

2.1 Prefield Activities

Prior to initiating the field activities for both the 6th Street Warehouse source area investigation and the source area removal activities, the following activities were completed:

- The planned source removal areas and investigation area were marked in white paint. USA Alert was notified and a private utility locating firm surveyed the area for subsurface utilities.
- Turn-key Construction Services, Inc. (Turn-key) obtained permits for the planned soil excavation and for the removal to the buried wooden tank (assumed to be an underground storage tank) from the SRFD.
- Turn-key obtained a grading permit from the City of Santa Rosa Building Department.
- Kennedy/Jenks obtained soil boring permits from the County of Sonoma Department of Health Services Environmental Health Division.
- A site control grid was established to facilitate locating the positions of the soil sampling locations. The site control grid consisted of 40-foot grid sections across the entire Site. The 0.0 point was the juncture of northeast corner of the 6th Street Warehouse and 6th Street. The grid sections moved to the south and to the east, designated by letters (north-south orientation) and numbers (east-west orientation). The site control grid is shown on Figure 2.
- The Site was fenced during the week of 6 October 2003 prior to initiating field activities.
- Turn-key obtained a one-time wastewater discharge permit from the City of Santa Rosa Utilities Department for the discharge of groundwater to the City's sanitary sewer.
- Turn-key mobilized two 21,000-gallon storage tanks to the Site for the temporary storage of groundwater pumped from the excavations.

2.2 Laboratory Analysis

Excelchem Environmental Labs (State Certification No. 2119) (Excelchem) mobilized a mobile laboratory to the Site on 13 October 2003. The mobile laboratory was used to provide onsite and rapid turnaround analysis of total petroleum hydrocarbons as diesel (TPHd) and total petroleum hydrocarbons as motor oil (TPHmo) analysis during the source area investigation and source area removal actions to assist with removal decisions. Excelchem also provided fixed laboratory services for analyses that could not be conducted in the mobile laboratory.

The soil and groundwater samples collected during the source area investigation and source area removal actions were analyzed for various constituents depending on the area of the Site from which they were collected and the findings of previous investigations. The analytical methods used were:

- Total petroleum hydrocarbons as gasoline (TPHg) by EPA Method 8015, TPHd and TPHmo analysis by EPA Method 8015 following silica gel cleanup by EPA Method 3630.
- Arsenic and lead analysis by EPA Method 6010B.
- Benzene, toluene, ethylbenzene and total xylenes (BTEX) by EPA Method 8020.

Samples collected from the soil stockpiles for profiling and disposal were also selectively analyzed for:

- Semivolatile organic compounds, including polycyclic aromatic hydrocarbons by EPA Method 8270.
- Volatile organic compounds (VOCs) by EPA Method 8260.
- Title 22 metals by EPA Method 6010 series.
- Mercury by EPA Method 4770A.

The analysis of the stockpiled soil was at the direction of the disposal facilities and was reduced to just TPHd and TPHmo for the last stockpiles. The laboratory analytical results are presented in tables and referenced in specific sections herein. Copies of the laboratory analytical reports and chain-of-custody records are presented in Appendix A.

2.3 General Source Area Excavation Notes

Source area removal actions were conducted from 15 October 2003 until 13 November 2003. The removal actions moved between the Northwestern Area, the Southern Warehouse area and the Fenced Enclosure based on construction access considerations, the availability of Regional Board and SRFD personnel to observe the confirmation sampling, and the concurrence of either the Regional Board or SRFD personnel that removal of impacted soil from a source area had been completed and the area could be backfilled.

The source area removal actions were interrupted by periods of rain resulting in unsafe working conditions, which delayed the remedial actions.

Excavated soils were stockpiled on plastic sheeting and covered with plastic sheeting at the end of each working day. Approximately 6,500 cubic yards of impacted soil were excavated and placed into 13 stockpiles of approximately 500 cubic yards each. The stockpiled soils are awaiting offsite disposal.

Investigation derived residuals (IDRs), including decontamination water from the confirmatory soil sampling and the source area investigation along the 6th Street Warehouse, were added to the "wet" stockpile, Stockpile No. 7. Turn-key established Stockpile No. 7 as a holding cell for

saturated soils ("wet") excavated from below groundwater. The holding cell was constructed by creating a berm from clean import material on the edges of the underlying plastic sheeting. The berm served to contain any liquid that may have drained out of the saturated soils.

Once either the Regional Board or SRFD gave their concurrence that removal actions at each of the areas were complete, the excavations were backfilled with clean import material. Stonypoint Quarry in Cotati, California provided the backfill material. Fill material below groundwater was a 1-1/2-inch drain rock. Fill material above groundwater was a 3/4-inch minus quarry material. A total of 866 tons of drain rock, and 6,252 tons of quarry material was used to backfill the excavations. The backfill material was placed in approximately 12-inch lifts and compacted to a minimum of 90% compaction from the bottom of the excavation to the ground surface. Construction materials testing provided compaction testing to Turn-key.

Selected figures, identified in specific sections of this Report, present the laboratory analytical data generated during the investigation and remedial action field activities conducted in October and November 2003. In addition and where applicable and informative, analytical data from previous investigations is included. Refer to the legend on Figure 2 for identification of the symbols used to differentiate the data sets.

Removal action and confirmatory soil sampling identification was recorded by the area of collection (Southern Warehouse [SW], Fenced Enclosure [FE], Northwestern Area [NW]), the grid number, sequential number of sample collected and depth below ground surface (bgs). For example, the ninth sample collected overall from Northwestern Area during the wooden tank removal action from a depth of 7 feet bgs in grid section B2, was identified as NW-B2-9C-7. Confirmatory soil samples were collected during the source area removal actions under the direction of either the Regional Board or the SRFD. The confirmatory samples are designated by a "C" in the accompanying tables and figures. Additional soil samples were collected during the source area removal actions without the assistance of the Regional Board or SRFD to guide the excavation procedures and are referred to herein as removal action samples. The soil sampling designation is truncated on the figures to only the sequential number of the sample, and the letter "C" if it was a confirmatory sample, to save space and provide clarity.

Removal action and confirmation soil samples were collected in 2-inch by 3-inch brass tubes by pushing the tube into the soil in the excavator bucket (for samples collected from depths greater than 5 feet below ground surface [bgs]) or the bottom or sidewalls of the excavation. The tubes were sealed with Teflon™ tape, capped, recorded onto a chain-of-custody record.

The soil samples collected from the 6th Street Warehouse investigation were identified by the boring number and depth bgs. The reconnaissance groundwater samples were identified by the boring number, or by the boring number followed by the letter "w".

Section 3: 6th Street Warehouse Source Area Investigation

Nineteen soil borings were advanced at the locations shown on Figure 3 on 14 and 15 October 2003. The borings were advanced within grid sections A1 through F1 and identified as SRB-104 through SRB-122.

Vironex Environmental Field Services (C-57 License No. 705927) provided drilling services. The borings were advanced into the first encountered groundwater using a hydraulic push rig. Groundwater was encountered at approximately 20 to 21 feet bgs in the 6th Street Warehouse Source Area Investigation area.

A continuous soil core was collected from each boring in an acetate liner to allow visual observation of the core. Soil samples were removed from the core for laboratory analysis based on the visual observation. A minimum of three soil samples were collected from each core at depths of approximately depths of 5 feet, 10 feet, 15 feet or 20 feet bgs (or until groundwater was encountered). A reconnaissance groundwater sample was collected from each boring by inserting a 1-inch diameter screened polyvinyl chloride (PVC) pipe into the borehole and lowering a bailer into the PVC pipe. The recovered groundwater was decanted into a 1-liter amber bottle and delivered to the mobile laboratory. At the completion of each boring, the boring was backfilled with a cement bentonite slurry to the ground surface.

The soil and reconnaissance groundwater samples were analyzed for TPHd and TPHmo by Excelchem in the mobile laboratory. The analytical results are summarized in Tables 1 and 2.

The results of the field investigation indicated elevated concentrations of TPHd or TPHmo, or both, generally from just below the ground surface to groundwater in soil borings SRB-114, SRB-113, SRB-112, SRB-111 and SRB-118. Visual inspection of the soil cores removed from these borings generally showed that these cores contained evidence of petroleum hydrocarbon contained within the soil pores. The petroleum hydrocarbon varied from crystalline and dry, with a dull appearance to a more liquid state that glistened and reflected daylight. In all cases, the observed petroleum hydrocarbons in the soil cores was highly viscous and not readily flowing through the soil column.

Reconnaissance groundwater samples collected from soil borings SRB-112, SRB-118, SRB-105, SRB-106 and SRB-122 contained non-aqueous phase liquids (NAPL) which is reflected in the elevated TPHd and TPHmo concentrations (from 2,200,000 micrograms per liter [µg/l] to 66,000,000 µg/l) reported by the laboratory for those samples. TPHd and TPHmo were detected in other reconnaissance groundwater samples collected during the investigation, but at lower concentrations (from less than 50 µg/l to 8,100 µg/l). Reconnaissance groundwater samples typically contain suspended soil particles, so the results may be due to NAPL or to chemicals in soil rather than chemicals in groundwater. None of the reconnaissance groundwater samples were filtered in the field or in the laboratory at the direction of the Regional Board and the results of samples collected from soil borings SRB-112, SRB-118, SRB-105, SRB-106, and SRB-122 are not considered indicative of dissolved phase TPHd or TPHmo.

Section 4: Source Area Removals

4.1 Southern Warehouse

Limited source area removals were planned in the general vicinity of the Southern Warehouse within grid sections L1, M1 and N1. Based on the results of previous investigations, soils in the vicinity of boring locations SRB-21, SRB-40 and SRB-41 contain TPHd and TPHmo. In addition, arsenic was detected above background in samples collected from both SRB-40 and SRB-41 to depths of approximately 8 feet bgs. The excavation was guided by visual observation of staining and the results of the removal action soil sampling analytical results. Confirmatory soil sampling was conducted in the presence of the Regional Board and the SRFD. Excavation continued until the combined removal action and confirmatory soil sampling analytical results indicated that the impacted soil had been removed and the Regional Board and the SRFD gave their approval to backfill the excavations.

The limits and depths of the Southern Warehouse excavations, the analytical results from the removal action soil sampling, previous investigations and the confirmatory soil sampling are shown on Figures 4 and 5. Approximately 270 cubic yards of soil were removed from these two excavations.

The laboratory analytical results from this removal action are summarized in Table 3. The confirmatory soil samples collected from the Southern Warehouse excavations were analyzed in the mobile laboratory for TPHd and TPHmo. The deeper confirmatory samples from the vicinity of SRB-40 and SRB-41 excavations were analyzed by at Excelchem's fixed laboratory for arsenic on a rush turnaround basis.

4.2 Fenced Enclosure

Limited source area removals were planned in the Fenced Enclosure within grid sections L6 and M6. Based on the results of previous investigations, soils in the vicinity of boring locations SRB-70, SRB-71 and SRB-96 contained TPHg, TPHd, TPHmo, and BTEX. The excavation was guided by visual observation of staining and the results of the removal action soil sampling analytical results. Confirmatory soil sampling was conducted in the presence of the Regional Board or the SRFD. Excavation continued until the combined removal action and confirmatory soil sampling analytical results indicated that the impacted soil had been removed and the Regional Board and the SRFD gave their approval to backfill the excavations.

The limits and depths of the Fenced Enclosure excavations, the analytical results from the removal action soil sampling, previous investigations and the confirmatory soil sampling are shown on Figure 6. Approximately 62 cubic yards of soil were removed from the Fenced Enclosure. The presence of an energized power pole located inside the Fenced Enclosure and just to the northeast of the trailer precluded sufficient excavation to remove TPHmo impacted soil from this immediate area. TPHmo at a concentration of 1,100 milligrams per kilogram (mg/kg) remain beneath the power pole at a depth of 0.5 feet bgs. Attempts to coordinate with the power pole owner to have the power pole de-energized and the pole removed to allow additional excavation to proceed in this area was unsuccessful during the removal actions.

Based on the other removal actions conducted in the Fenced Enclosure, the remaining TPHd at the base of the power pole is likely to be limited in extent and shallow.

The laboratory analytical results from the Fenced Enclosure removal action are summarized in Tables 4 and 5. The confirmatory soil samples collected from Fenced Enclosure excavations were analyzed in the mobile laboratory for TPHg, TPHd and TPHmo. Analyses for BTEX and lead were conducted at Excelchem's fixed laboratory on a rush turnaround basis.

4.3 Northwestern Area

The previous investigations conducted in the Northwestern Area indicated the presence of petroleum hydrocarbons. The analytical data indicated isolated pockets of impacted soil and not a general distribution over the entire area. Elevated levels of TPHd and TPHmo had been detected in soil samples collected along the former underground petroleum pipeline trench at depths up to 5 feet bgs, particularly at the western end of the trench near sampling location PL-12. The observation of a wooden UST uncovered during a potholing investigation conducted in the early summer of 2003 indicated that soils in the tank and surrounding area contain visually impacted soil. The reported elevated levels of TPHd and TPHmo in soil samples collected from borings SRB-75, SRB-99 and SRB-100 supported the observations of soil conditions around the wooden tank. The findings of the previous investigations were supported by the 6th Street Warehouse Source Area Investigation conducted as part of these field activities.

Source area removals along the pipeline trench, the wooden tank and the overall Northwestern Area proceeded to the limits shown on Figures 7 through 14. The areas of excavations became known as the UST excavation (wooden tank area), main pit excavation (encompassing and extending beyond soil borings SRB-114, SRB-112, SRB-111 and SRB-118), pipeline excavation, the GM excavation (at the southern end of the pipeline excavation) and the SRB-113 pit excavation. These areas are designated on the referenced drawings.

The laboratory analytical results for the removal action and confirmatory soil sampling analytical results are summarized in Table 6. The removal action and confirmatory soil samples were analyzed for TPHd and TPHmo by the mobile laboratory. The analytical results from the excavation pit dewatering conducted as part of the removal actions in the Northwestern Area are summarized in Table 7. The mobile laboratory performed groundwater TPHd and TPHmo analysis. Groundwater VOC analysis required by the City of Santa Rosa Utilities Department for the one-time discharge permit was performed at Excelchem's fixed laboratory.

4.3.1 UST Excavation

Source area removals began with a search for the wooden UST. Remnants of the wooden tank were encountered at approximately 10 feet bgs near intersection of grid lines B and 3 and near the location of SRB100 from a previous investigation. The wooden structure of the tank was rotted and could only be removed in small pieces. The tank remnants were added to the soil stockpiles for offsite disposal. The former tank was determined to be 18 feet in diameter. Excavation proceeded to remove visually impacted soil to a depth of approximately 18 to 19 feet bgs.

Groundwater began to seep into the excavation at 19 feet bgs. A gravel lens encountered at this depth in the northeastern corner of the excavation seeped NAPL into the excavation and onto the groundwater. The NAPL seepage from this location is in keeping with the NAPL observed in the reconnaissance groundwater sample collected from soil boring SRB-122. The soil samples collected from soil boring SRB-122 at depths of 5 feet, 10 feet and 20 feet bgs did not detect TPHd or TPHmo above the laboratory reporting limits (Table 1).

A ramp was excavated into the UST excavation from the south to allow excavation to greater depths. An additional 3 to 4 feet of material was removed from the bottom of the excavation and below the groundwater level. As much of the gravel lens that could be safely reached was removed as the excavation proceeded to the west, following the gravel lens.

The limits and depths of the UST excavation, the analytical results from the removal action soil sampling, previous investigations and the confirmatory soil sampling are shown on Figure 11. Approximately 700 cubic yards of soil were removed from the UST excavation. The presence of 6th Street to the north and the City of Santa Rosa sanitary sewer to the east presented site constraints to further excavations in these directions. The soil removal and confirmatory soil sample analytical results from the bottom and sidewalls of the UST excavation supported the decision that no further excavation was necessary. The Regional Board and the SRFD concurred with this decision.

Groundwater and NAPL seeping into the UST excavation was pumped into two 21,000-gallon temporary holding tanks on three occasions. The NAPL was observed to be floating on top of the groundwater and the water underneath the NAPL to be clear. Between each pumping event, Turn-key skimmed the NAPL from the top of the water with absorbent booms attached by ropes to the excavator bucket. A water sample was collected from the UST excavation by dropping a bailer into the excavation. The length of the bailer for collecting the water sample caused sediment from the bottom of the excavation to mix with the water resulting in a turbid sample. The elevated detections of TPHd and TPHmo in the UST Ex water sample are attributed to the sediment in the sample (Table 7). This water sample was not filtered in the field or the laboratory and the results are not considered indicative of dissolved phase TPHd or TPHmo.

Backfilling of the UST excavation began on 29 October 2003 with the concurrence of the Regional Board and the SRFD.

4.3.2 Pipeline and Main Pit Excavation

Almost simultaneously with the UST excavation, soil removal began at the northern end of the former petroleum pipeline trench. This pipeline and some soils had been previously removed from the area shown in general on Figure 2 and in detail on Figures 11 through 14. As the excavation along the pipeline trench proceeded south, visibly stained soil was removed and soil removal samples were collected to guide the excavation. The pipeline excavation expanded into the main pit excavation in the general vicinity of soil borings SRB-118, SRB-112 and SRB-111. The main pit excavation proceeded to the west until the halting at approximately 20 feet east of the 6th Street Warehouse.

Excavation along the pipeline trench along the southern edge of the main pit excavation was generally to depths ranging from 5 feet to 10 feet bgs. Just to the south of grid line E, between grid line 2 and 3, a layer of debris consisting of broken ceramics, bottles and rusted metal was encountered and removed (Figure 13).

Just south of monitoring well SRMW-10, the end of a 6-inch diameter steel pipe was encountered at a depth of approximately 4 feet bgs near grid lines C2. The excavation followed the pipe to the south across grid lines D, E, F and G. Approximately 12 feet south of grid line G, the steel pipe entered a 36-inch diameter concrete pipe traveling east to west and buried approximately 3 feet bgs. The steel pipe was removed during the excavation. The connection to the concrete pipe was patched with concrete. The concrete pipe was left in place. This concrete pipe is assumed to be part of the City of Santa Rosa storm drain system.

Groundwater began to seep into the main pit excavation at 19 feet bgs. A petroleum product seeped into the excavation and onto the groundwater, primarily from the southern and western faces of the excavation. This seepage of product from these areas is in keeping with the observed product in the reconnaissance groundwater sample collected from soil borings SRB-112 and SRB-118.

A ramp was excavated into the main pit excavation from the south to allow excavation to greater depths. An additional 2 to 3 feet of material was removed from the bottom of the excavation and below the groundwater level.

The limits and depths of the pipeline trench and main pit excavation, the analytical results from the removal action soil sampling, previous investigations and the confirmatory soil sampling are shown on Figures 8, 9, 10, 12 and 13. Approximately 3,500 cubic yards of soil were removed from the pipeline trench and main pit excavation. The presence of the 6th Street Warehouse to the west presented site constraints to further excavations in this direction.

Groundwater and NAPL seeping into the main pit excavation was pumped into the two 21,000-gallon temporary holding tanks on numerous occasions. The NAPL was observed to be floating on top of the groundwater and the water underneath the NAPL to be clear. The Regional Board observed this fact by throwing a small rock into the NAPL to observe the clear water beneath. Between each pumping event, Turn-key skimmed the NAPL from the top of the water with absorbent booms attached by ropes to the excavator bucket. A water sample was collected from the main pit excavation by lowering a five-gallon bucket into the water and then decanting the water into a 1-liter amber bottle. This method avoided the sediment disturbance that occurred at the UST excavation.

Backfilling of the main pit excavation began on 4 November 2003 with the concurrence of the Regional Board. Additional soil excavation at the western edge of the main pit excavation was conducted after the main pit was backfilled and compacted. This additional excavation was conducted on 12 and 13 November 2003, at the request of the SRFD, to remove elevated concentrations of TPHd and TPHmo in vadose zone soils as detected in removal action samples NW-E1-44-13.5, NW-E1-45-9, NW-E1-46-5, NW-F1-49-14.5, NW-F1-50-8 and NW-F1-51-5 (Table 6 and Figure 9). Because of the proximity of the 6th Street Warehouse and the depth of the main pit excavation (approximately 22 feet bgs), this excavation could not proceed until the backfill operations were complete and the western sidewall of the main pit excavation stabilized sufficiently to carry the weight of the building, the excavator and a loaded

dump truck. The 12 and 13 November 2003 excavation was conducted to maintain a 1.5 horizontal to 1 vertical slope from the 6th Street Warehouse to the western edge of the main pit excavation to support the warehouse and foundation, and equipment. This allowed for excavation to a maximum depth of 13.3 feet bgs at the western edge of the main pit excavation 20 feet east of the 6th Street Warehouse.

4.3.3 GM Excavation

At the southern end of the former petroleum pipeline trench, high concentrations of TPHd and TPHmo had been detected during the pipe removal. During this removal action, this area was overexcavated to the limits and depths shown on Figure 14. Approximately 325 cubic yards of material was removed from this excavation.

Groundwater began to seep into the GM excavation at 15 feet bgs. A small amount of NAPL seeped into the excavation and onto the groundwater. The groundwater and NAPL that seeped into the excavation were pumped to the temporary holding tanks. Between each pumping event, Turn-key skimmed the NAPL from the top of the water with absorbent booms attached by ropes to the excavator bucket. A water sample was collected from the GM pit excavation by lowering a five-gallon bucket into the water and then decanting the water into a one-liter amber bottle. This method avoided the sediment disturbance that occurred at the UST excavation.

Backfilling of the GM pit excavation began on 31 October 2003 with the concurrence of the Regional Board and the SRFD.

4.3.4 SRB-113 Pit Excavation

Additional excavation was conducted in the vicinity of soil boring SRB-113 after the main pit excavation and the pipeline trenches to the east of soil boring SRB-113 were backfilled and compacted. This excavation was conducted separately from the main pit excavation upon realization that the main pit excavation did not include soil in the vicinity of soil boring SRB-113 which had been found to contain elevated concentrations of the TPHd and TPHmo based on the 6th Street Warehouse Source Area Investigation. The SRB-113 pit excavation was delayed until the main pit was backfilled and compacted for stability and safety reasons as discussed in Section 4.3.2. During this removal action, this area was overexcavated to the limits and depths shown on Figure 8. Approximately 500 cubic yards of material was removed from this excavation.

Groundwater began to seep into the SRB-113 excavation at 19 feet bgs. A small amount of NAPL seeped into the excavation and onto the groundwater. The groundwater and NAPL that seeped into the excavation were pumped to the temporary holding tanks. Between each pumping event, Turn-key skimmed the NAPL from the top of the water with absorbent booms attached by ropes to the excavator bucket. A water sample was collected from the SRB-113 pit excavation by lowering a five-gallon bucket into the water and then decanting the water into a one-liter amber bottle. This method avoided the sediment disturbance that occurred at the UST excavation.

Backfilling of the SRB-113 excavation began on 14 November 2003 with the concurrence of the Regional Board. A hard rain was falling at the Site at this time and the sidewalls of the SRB-113

pit were becoming soft and unstable at the time the Regional Board granted their approval to backfill the SRB-113 pit.

4.3.5 Site Restoration Activities

Completing the backfill and compaction of the various excavations proceeded from 14 November until 19 November 2003, when weather and site conditions would allow safe working conditions. The groundwater pumped from the various excavations was discharged into the City of Santa Rosa sanitary sewer under the one-time discharge permit.

Equipment demobilization was completed on 19 November 2003.

Section 5: Waste Management

5.1 Groundwater

Approximately 70,000 gallons of groundwater and NAPL were pumped from the various source area excavations during these removal actions. The groundwater and NAPL were temporarily stored in two 21,000-gallon tanks.

Two samples of the groundwater and NAPL were collected for laboratory analysis of TPHd and TPHmo. The second sample was also analyzed for VOCs as a condition of the City of Santa Rosa one-time wastewater discharge permit. The laboratory analytical results are summarized in Table 7.

The TPHd, TPHmo, and methylene chloride (the only VOC detected) concentrations detected in the samples were below the City of Santa Rosa Utilities Department acceptance criteria and the one-time permit was issued. The pumped groundwater and NAPL was discharged to the City of Santa Rosa's sanitary sewer over a period of days.

5.2 Soil Stockpile Disposal

Approximately 5,360 cubic yards of soil was excavated and stockpiled during the source area removal actions. An additional 1,100 cubic yards of soil was already stockpiled onsite in various piles. These small piles were evaluated during the removal actions for possible reuse as backfill material. All the small piles were observed to be visually stained and subsequent laboratory testing of composite samples collected from these piles indicated the presence of TPHd and TPHmo. The small piles were consolidated into larger stockpiles and will be removed for offsite disposal with the excavated soil.

There are 13 stockpiles onsite, each containing approximately 500 cubic yards of soil. Four to one composite samples were collected from each stockpile for laboratory analysis for chemical constituents as required by the disposal facilities for profiling for acceptance. The results of the stockpile composite sampling analyses are summarized in Tables 8 through 11. Stockpile No. 11, which was comprised of consolidated piles of soil found onsite, was not sampled. Composite sampling of Stockpile No. 11 will be completed prior to its removal from the Site.

Waste Management has accepted the stockpiled soil for use as daily cover at the Altamont Landfill in Livermore, California. Removal of the soil stockpiles from the Site is tentatively scheduled for the week of 2 February 2004.

Section 6: Discussion and Recommendations

Source area removal actions were conducted at the Southern Warehouse, the Fenced Enclosure and the Northwestern Area in October and November 2003. Soils containing petroleum hydrocarbons and selected metals were excavated, stockpiled and will be removed from the Site for offsite disposal. Remediation of the source area soils is complete with a few minor exceptions.

An anticipated small volume of soil containing TPHd remains at the base of the power pole inside the Fenced Enclosure. This soil should be properly managed once the power pole is de-energized and removed during Site redevelopment activities.

Pockets of soil containing TPHd and TPHmo remain at depths generally greater than 10 feet bgs in the Northwestern Area. These pockets remain because they were inaccessible due to site constraints and safety considerations. These pockets are in the vicinity of, and west of, soil borings SRB-112 and SRB-113. It is also assumed, based on the results of previous investigations and the findings of the 6th Street Warehouse Source Area Investigation, that TPHd and TPHmo impacted soil extends under the 6th Street Warehouse at groundwater level. This material is inaccessible.

Based on the source removal work conducted in October and November 2003 and the analytical results, Kennedy/Jenks recommends that the remediation of Site soils is complete. No further action to address impacts to soils is necessary or warranted.

Neither the presence of impacted soil prior to removal nor the soil remediation efforts requiring excavation below groundwater appear to have impacted groundwater. The fourth quarter 2004 groundwater monitoring event was completed on 9 December 2003, following the completion of the source area removal actions. TPHd and TPHmo were not detected in any of the groundwater samples collected from the Site wells. The fourth quarter results are consistent with previous results. The *Fourth Quarter 2003 Groundwater Monitoring Report* will be submitted under separate cover.

To better evaluate if the source area removal actions and excavating below groundwater have impacted groundwater, two new groundwater monitoring wells should be installed at the locations shown on Figure 15. These new wells should be included in the ongoing groundwater monitoring of the existing five wells associated with the Site. A well installation work plan will be submitted to the Regional Board under separate cover.

NW-E1-118-10	10	**760**	**510**	11/13/03

(a) mg/kg = milligrams per kilogram.
(b) feet bgs = feet below ground surface.
(c) TPHd = Total petroleum hydrocarbons as diesel analysis by EPA Method 8015m with silica gel cleanup.
(d) TPHmo = Total petroleum hydrocarbons as motor oil analysis by EPA Method 8015m with silica gel cleanup.
(e) < = Analyte not detected at or above stated laboratory reporting limit.
(f) Sample collected at the direction of regulatory agency personnel.

Results equal to, or greater than, laboratory reporting limit are presented in **BOLDFACE** to facilitate identification.

Table 7: Summary of Excavation Pit Dewatering Water Sample Analysis – Total Petroleum Hydrocarbons and VOCs

		Analytical Results (µg/l)[a]					
		TPHd[b]		TPHmo[c]		VOCs[d]	
Sample Identification	Date Sampled	Filtered	Unfiltered	Filtered	Unfiltered	Analyte	Results
Holding Tanks							
Frac Tank 10/24	10/24/03	--[e]	4,500	--	3,300	--	
Frac Tank - 2	10/27/03	--	140	--	800	Methylene chloride	120
Excavation Pit							
UST Ex	10/29/03	--	21,000	--	17,000	--	
GM Water	10/31/03	180	320	<500[f]	<500	--	
Main Pit Water	11/04/03	210	180	<500	<500	--	
SRB-113-Pit	11/14/03	71	110	<500	<500	--	

(a) µg/l = micrograms per liter.
(b) TPHd = Total petroleum hydrocarbons as diesel analysis by EPA Method 8015m with silica gel cleanup.
(c) TPHmo = Total petroleum hydrocarbons as motor oil analysis by EPA Method 8015m with silica gel cleanup.
(d) VOCs = Volatile organic compounds analysis by EPA Method 8260B. Only analytes detected above laboratory reporting limits are listed.
(e) -- = Not analyzed
(f) < = Analyte not detected at, or above, stated laboratory reporting limit.

Table 8: Summary of Stockpile Composite Sample Analytical Results – Total Petroleum Hydrocarbons

Sample Identification	Date Sampled	Analytical Results (mg/kg)[a]		
		TPHg[b]	TPHd[c]	TPHmo[d]
Stockpile No. 1	10/17/03	4.1[e]	1,700	2,100
Stockpile No. 2	10/20/03	--[f]	550	700
Stockpile No. 3	10/21/03	--	<100[g]	550
Stockpile No. 4	10/21/03	--	5,300	3,700
Stockpile No. 5	10/22/03	--	1,300	1,400
Stockpile No. 6	10/24/03	--	2,000	2,100
Stockpile No. 7	10/24/03	--	<100[g]	470
Stockpile No. 8	10/29/03	--	140	160
Stockpile No. 9	10/29/03	--	16	150
Stockpile No. 10	10/29/03	--	390	350
Stockpile No. 12	10/31/03	--	630	610
Stockpile No. 13	11/13/03	--	500	510

(a) mg/kg = milligrams per kilogram
(b) TPHg = Total petroleum hydrocarbons as gasoline analysis by EPA Method 8015m.
(c) TPHd = Total petroleum hydrocarbons as diesel analysis by EPA Method 8015m.
(d) TPHmo = Total petroleum hydrocarbons as motor oil analysis by EPA Method 8015m.
(e) Laboratory reports that the sample chromatogram does not match the standard gasoline chromatogram. All peaks were integrated within the gasoline range. The reported result in an estimate.
(f) -- = Not analyzed.
(g) < = Analyte not detected at or above stated reporting limit.

Table 9: Summary of Stockpile Composite Sample Analytical Results – VOCs[a] and SVOCs[b]

		Analytical Results (mg/kg)[c]			
		VOCs		SVOCs

Site Assessment Work Plan

Union Pacific Railroad
2 Fourth Street and 34 Sixth Street, Santa Rosa, California
North Coast Regional Water Quality Control Board Case No. 1TSR196

1.0 INTRODUCTION

Antea™Group has prepared this *Site Assessment Work Plan* on behalf of Union Pacific Railroad (UPRR) in response to the North Coast Regional Water Quality Control Board (RWQCB) directive letter dated January 19, 2012 **(Appendix A).** The site is currently in the process of redevelopment. This work plan proposes the following activities to address RWQCB concerns:

- additional soil excavation in the vicinity of EBA Engineering (EBA) boring SB-1,
- qualitative groundwater assessment in the vicinity of the recently removed underground storage tanks (USTs) to investigate separate phase hydrocarbons encountered during UST removal and to determine the optimal placement of up to four groundwater monitoring wells, and
- a review of available case files for the property to the west of the site and the advancement of soil borings along a section of the southwest property boundary to aid in determining the relationship between on-site and off-site contamination.

1.1 Site Description

Currently, the site is vacant with no operations. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the 3 West Third Street and 60 West Sixth Street Warehouses, to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties (**Figure 1**).

1.2 Site History

The site was historically used as a railroad freight depot and maintenances/fueling yard from the late 1800's through the 1960's. This site became vacant and generally unused since the late 1960's. Consultants have conducted environmental investigations and remediation efforts at the site since 1987. Former operations at the site include the use of aboveground storage tanks (ASTs), underground storage tanks (USTs), a main railroad track system that occupied the eastern portion of the property, several associated railroad spurs and siding, a turntable, warehouses, and freight houses. A Sanborn Fire Insurance map dated 1885 indicates the Santa Rosa Woolen Mills was located in the northwestern portion of the site until approximately 1906 (EBA, 2009a). **Appendix B** includes a summary of environmental investigations and remedial activities conducted at the site. **Figure 2** shows the locations of historic borings and wells at the site.

1.3 Geologic and Hydrogeologic Setting

1.3.1 Regional Geology

The site is centrally located within the Santa Rosa Plain, which is part of the Coast Range Geomorphic Province of northern California. The Coast Range Geomorphic Province is characterized as a series of northwest trending elongated ridges and valleys that are a result of folding and faulting. The Santa Rosa Plain consists of alluvial fan deposits of Pleistocene and Holocene age. The alluvial fan deposits form a nearly continuous blanket over the Santa Rosa Plain and consist of poorly sorted coarse sand and gravel, moderately sorted fine sand and silt, and silty clay. The region has been mapped as having basement materials that underlie the alluvial fan deposits. The basement materials consist of marine sedimentary rocks of the Miocene Age Wilson Grove Formation. Portions of the Wilson Grove Formation are overlain by younger continental sedimentary rocks of the Pliocene-Pleistocene Age Glen Ellen Formation (EBA, 2008b).

1.3.2 Site Geology and Hydrogeology

The geology of the project site is characterized by shallow rocky fill in the upper one to two feet below ground surface (bgs) that is underlain by sandy silt and clayey sediments containing varying amounts of angular to sub-rounded gravel. These finer-grained sediments extend to approximately 20 feet bgs, and are underlain by a laterally continuous sandy coarse-grained unit extending to at least 25 feet bgs, the maximum depth explored at the project site to date (EBA, 2008b).

The hydrogeology of the project site is likely controlled by gradational lenses of sediments separated by clayey layers. A thin, laterally extensive sandy unit located at an average depth of approximately 13-15 feet bgs overlays a similarly laterally extensive clayey bed. The more impervious clay units likely act as confining layers and inhibit the downward vertical migration of fluids. Based on this observation, the resulting perched groundwater in the upper permeable sand unit at 15 feet bgs has been independently sampled from the deeper water-bearing zone present at a depth of approximately 20 to 25 feet bgs (EBA, 2008). However, EBA noted that wells SRMW-7 and SRMW-8 were screened across both zones. The predominant groundwater flow direction is approximately west-southwest across the project site towards Santa Rosa Creek (approximately 160 feet beyond the western side of the property). Therefore, the eastern portion of the project site is considered up gradient relative to the western portion (EBA, 2008b).

2.0 SITE INVESTIGATION

2.1 Proposed Scope of Work

As stated in the introduction, Antea Group proposes to address RWQCB concerns by conducting the following activities:

- **Soil Excavation**: Antea Group will excavate soil in the area of soil boring SB-1 to remove hydrocarbon impacted soil observed at 12 feet bgs by EBA during their 2008 investigation..

- **Qualitative Borings (QB-1 through QB-8):** Antea Group will advance up to eight soil borings utilizing direct push rods equipped with cone penetration testing (CPT) tip and Ultra-Violet Optical Screening Tool (UVOST). Borings will be advanced in the vicinity of the UST excavation where in November 2011, two 550-gallon tanks were removed by United Pumping Services (UPS) and encountered separate phase hydrocarbons within the excavation. The data from these borings will be used as a screening tool only, with the goal of determining the extent of separate phase hydrocarbons (SPH) present in groundwater and to determine the ideal location of up to four (4) groundwater monitoring wells.

- **Monitoring Wells (MW-1 through MW-4):** Antea Group will install up to four monitoring wells, pending review and analysis of the qualitative boring data, to determine groundwater impacts in the vicinity of the former UST excavation. Based upon an evaluation of qualitative data from the UVOST advancement, Antea Group will determine optimal well placement upgradient of, within, and downgradient from the area demonstrating separate phase impacts.

- **Soil Borings (SB-62 through SB-66) and Temporary Monitoring Wells:** Antea Group will advance five soil borings along the southwest property boundary to evaluate the relationship between on-site and off-site contamination.

Each of these activities are discussed further in **Section 2.3**.

2.2 Pre-Field Activities

Prior to initiating field activities, Antea Group will prepare a Health and Safety Plan (HASP) in accordance with Title 8, Section 5192 of the California Code of Regulations. The HASP will contain a list of regulatory and emergency contacts, as well as a hospital route map to the nearest emergency facility. Field personnel will conduct a daily review for site-specific updates or changes in work conditions. UPS will obtain the necessary permits for the excavation from the City of Santa Rosa Fire Department and Planning agencies. Antea Group will obtain all necessary soil boring and monitoring well installation permits. In addition, Antea Group and UPS will conduct pre-field notifications, as required by the regulatory and permitting agencies.

2.3 Field Activities

Prior to ground disturbance, Antea Group and UPS will contact Underground Service Alert (USA) North to mark the site for subsurface utilities. Antea Group also contact UPRRs fiber optic hotline as required, and will employ the services of a private underground utility locater to verify utility locations marked by USA members and to identify any other potential unmarked underground utilities or obstructions in the vicinity of planned ground disturbances. In addition, a California C-57 licensed drilling company will clear each soil boring/well location via hand auger or air excavation (air knife) to a minimum depth of five feet bgs.

2.3.1 Soil Excavation

UPS will conduct soil excavation in the area of former soil boring SB-1, as proposed by EBA in their *Soil Excavation Work Plan* dated October 2009. **Figure 3** depicts the maximum lateral extent of the excavation (approximately 45 feet by 15 feet) with final vertical limits of approximately 15 feet bgs, or to the depth of groundwater, as directed by the RWQCB in their October 30, 2009 correspondence. **Appendix C** contains EBA's October 2009 Work Plan. Antea Group will carry out field activities as outlined in EBA's work plan in Sections 4.0 through 4.6 with the exception of their choice of analytical laboratory, their proposed sample analytical suite and their proposed groundwater treatment and subsequent discharge into the sanitary sewer.

Regarding the proposed change in sample analytical suite, widespread low-level volatile organic compounds (VOCs) & semi-volatile organic compounds (SVOCs), specifically tetrachloroethylene (PCE), trichloroethylene (TCE) and methyl tertiary-butyl ether (MTBE) appear to be ubiquitous to the area and not related to former onsite activities. Therefore, Antea Group proposes to omit VOCs and SVOCs from the analytical suite, and to analyze discreet soil samples only for the following:

- Diesel range organics (DRO), carbon chain range C10 – C28, and Motor oil range organics (MORO), carbon chain range C24 – C36, by EPA Method 8015B with silica gel cleanup;
- Polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270C SIM

For proper waste profiling, stockpiled soil samples from the excavation area will include the analytes listed above, plus the following VOCs, SVOCs, and metals:

- Gasoline range organics (GRO), benzene, toluene, ethylbenzene and xylenes (BTEX compounds) by EPA Method 8260B;
- PCE and TCE by EPA Method 8270C;
- California Assessment Manual (CAM) 5 metals: cadmium, chromium, nickel, lead, zinc by EPA Method 6010B.

Antea Group proposes to pump and containerize groundwater from the excavation. Any groundwater recovered from the excavation will be sampled for waste characterization and temporarily stored on-site site pending profiling and off-site transport and disposal at an appropriate waste facility. The water from the excavation will be sampled for the following:

- DRO, and MORO, by EPA Method 8015B with Silica Gel Cleanup;
- GRO and VOCs by EPA Method 8260B;
- SVOCs by EPA Method 8270C;
- PAHs by EPA Method 8270C SIM;
- Total and dissolved CAM 5 Metals: cadmium, chromium, nickel, lead, and zinc, by EPA Method 6010B.

2.3.2 Qualitative Borings

Antea Group will evaluate groundwater impacts in the vicinity of the former UST excavation using direct push rods equipped with CPT and UVOST modules (CPT-UVOST) in up to eight locations around the recently excavated tank pit area. **Appendix D** contains Geoprobe® CPT and UVOST product summaries and specifications. Antea Group will advance CPT-UVOST at four initial locations in the approximate locations indicated on **Figure 3**. Both CPT and UVOST sensors can be advanced in the same hole. The proposed terminus for each test boring is approximately 20 feet bgs; however, Antea Group will base the final depths on field conditions.

The location of the remaining four CPT- UVOST borings will be contingent upon the findings of the initial four borings. Antea Group's goal is to be able to qualitatively assess the lateral extent of the SPH impacts in the vicinity of the recently-excavated former UST location (using UVOST as a qualitative screening tool only).

2.3.3 Monitoring Well Installations

Once Antea Group has a general model of subsurface conditions using the qualitative borings, the locations of up to four monitoring wells will be determined. The optimal well locations will be upgradient of, within, and downgradient from, the area demonstrating the highest impact to groundwater, based upon an evaluation of qualitative data from the CPT-UVOST advancement. To protect the integrity of newly installed wells, the timing of well installation is contingent upon site redevelopment activities.

Monitoring Well Installation

Each well will be installed using eight-inch hollow-stem auger drilling equipment. The borehole will be advanced to five feet below the first encountered groundwater, with the well's screen interval extending approximately five feet above first encountered groundwater and five feet below. Actual depth and length of the screened interval will be determined by observed lithology during drilling and CPT-UVOST operations to prevent screening across the clay/silt unit that separates the shallow water-bearing zone from the deeper water-bearing zone. Soil samples will be collected at 5-foot depth intervals, and continuously below the depth of first-encountered groundwater during auger drilling using a California modified split-spoon sampler equipped with brass soil sleeves,.

The wells will be constructed of 2-inch diameter PVC casing with a manufactured well screen (0.020 inch slot size). A 2/12 sand filter pack will backfill the annulus to one foot above the well screen, followed by 2 feet of hydrated bentonite. The remainder of the annular space will be backfilled with neat-cement grout. A locking well cap will be placed on the well head. Antea Group will determine the appropriate well completion (flush mount or riser pipe) based on the redevelopment plans and type of construction activity in the proposed well locations.

Antea Group anticipates that two to three soil samples from each well location will be submitted for laboratory analysis; one from five feet bgs, one from ten feet bgs and/or the deepest unsaturated soil sample. Actual sample selection/depths will be determined based upon field observations (depth to water, or visual staining). Soil

samples will be collected in clean brass liners, capped with Teflon® sheets and tight-fitting plastic end caps, labeled, and placed in an ice-chilled cooler pending transportation to the laboratory. Soil samples will be analyzed for the following:

- DRO and MORO, by EPA Method 8015B with Silica Gel Cleanup;
- PAHs by EPA Method 8270C SIM;

Monitoring Well Development

Development of the newly installed monitoring wells will take place a minimum of 72 hours following installation. Well development will consist of surging the length of the screened interval for a minimum of 15 minutes and evacuating a minimum of 10 well casing volumes of groundwater. Field personnel will record groundwater parameters (depth to water, temperature, pH, conductivity, turbidity, etc) during the well development process. The final well installation report will include the well development logs. Following development, the wells will be allowed to stabilize for a minimum of 72 hours prior to the collection of any groundwater samples.

Monitoring Well Survey

Subsequent to completion, a California Licensed Land Surveyor will survey the latitude/longitude of each wellhead. The land surveyor will survey the top of casing elevations to North American Vertical Datum 88, accurate to the nearest 0.01 foot. Antea Group will include the survey data in the final assessment report and will upload the data to the state GeoTracker database as required.

2.3.4 Exploratory Soil Borings

Antea Group's selected drilling contractor will complete five soil borings on the southwestern boundary of the site (**Figure 3**). The drilling contractor will advance the borings utilizing direct-push technology (Geoprobe® or similar). Soil samples will be collected from each boring with four-foot long acetate sampling liners placed within the direct-push rods prior to boring advancement. The soil borings will be logged continuously using the Unified Soil Classification System (USCS) under the direction of a State Registered Professional Geologist. The proposed terminus for each exploratory boring is approximately 20 feet bgs; however, Antea Group will base the final depths on field conditions.

Antea Group will select samples for laboratory analysis based upon field observations (depth to water, or visual staining), but anticipates that three soil samples will be submitted for laboratory analysis, one from five feet bgs, the deepest unsaturated soil sample or samples exhibiting visual staining. Select soil samples will be cut from the four-foot long acetate liners, capped with Teflon® sheets and tight-fitting plastic end caps, labeled, and placed in an ice-chilled cooler pending transportation to the laboratory.

Following completion of each of the five soil borings, the driller will insert a pre-packed well screen for the collection of groundwater samples. The pre-packed well screens are five feet in length and consist of 3/4-inch

diameter Schedule 40 polyvinyl chloride (PVC) casing with 0.010-inch slots surrounded by 1.5-inches of 20/40 Grade sand encased in a stainless steel mesh. Insertion of the screens begins with the advancement of 3.25-inch direct-push rods driven to depth. The driller will then lower the pre-pack well screens with ¾-inch diameter Schedule 40 PVC riser pipe into the probe rods. Following collection of groundwater samples, each pre-packed screen will be removed and the boreholes subsequently sealed with bentonite grout.

Soil and groundwater samples will be analyzed for the following:

- DRO and MORO by EPA Method 8015B with Silica Gel Cleanup;
- PAHs by EPA Method 8270C SIM;

3.0 DECONTAMINATION AND DISPOSAL OF INVESTIGATION DERIVED WASTE

Prior to use and between boring locations, down-hole equipment will be carefully decontaminated using high-pressure hot water spray or an Alconox scrub solution followed by a double rinse in clean tap water and distilled water.

Soil cuttings and wastewater generated during drilling and development activities will be placed in Department of Transportation (DOT) approved 55-gallon drums, sealed and labeled in accordance with the corresponding DOT protocols for non-hazardous waste. The drums will be sampled for characterization and temporarily stored on-site pending profiling and disposal. Antea Group's waste management contractor will transport laboratory-profiled waste derived from the investigation, for disposal at an appropriate licensed facility. The final investigation report will include waste manifest documentation.

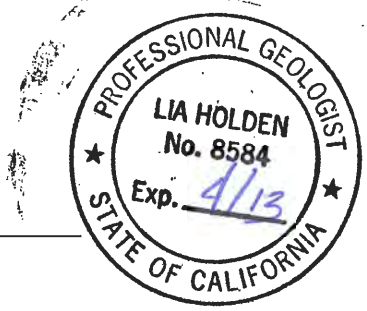
4.0 SCHEDULE AND REPORTING

Pre field-activities will begin upon regulatory approval of this work plan. Scheduling of field activities will commence following procurement of permits for excavation, borings and monitoring wells as well as access procurement from the property owner for the proposed work. Antea Group estimates excavation and boring advancement will be completed within two week of the start of field activities. In order to protect newly-installed wells, the timing of monitoring well installation is also contingent upon the property redevelopment schedule and final selected well locations. Upon completion of the proposed scope of work, Antea Group will prepare a summary report containing the following:

- An updated Base Map showing the final locations of the qualitative borings, monitoring wells and soil borings/temporary wells. The Base Map will also provide detailed information concerning the extent of the soil excavation and samples collected.
- A detailed description of the excavation, qualitative borings, monitoring wells, development logs, well survey data, soil borings and groundwater sampling;
- Analytical summary tables;
- Waste disposal manifests, and;
- Interpretation of the field and laboratory data and recommendations, as appropriate.

The proposed activities outlined in this work plan and the corresponding reports will be performed and prepared under the direction of a California Registered Geologist. In accordance with applicable regulatory requirements, all reports, maps, and analytical data will be uploaded to the State GeoTracker database.

5.0 REMARKS



The recommendations contained in this document represent Antea USA, Inc.'s professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This document is based upon a specific scope of work requested by the client. For any reports cited that were not generated by Delta or Antea Group, the data from those reports is used "as is" and is assumed to be accurate. Antea Group does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. The contract between Antea USA, Inc. and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this document will be performed. This document is intended only for the use of Antea USA, Inc.'s client and anyone else specifically identified in writing by Antea USA, Inc. as a user of this document. Antea USA, Inc. will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea USA, Inc. makes no express or implied warranty as to the contents of this document.

Gentlemen:

Subject: Case Status

File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, Case Nos. 1TSR196 and 1NSR196

In the Regional Water Board staff letter dated July 22, 2011, remaining items to be completed were identified, which included the removal of the oil underground storage tank; removal of known shallow soil impacts; and removal of impacted soil in the vicinity of SB-1. It was stated that if evidence of a discharge is revealed at the time of tank removal, contaminated soil must be removed and depending upon the degree of discharge, the impact to water quality may need to be investigated. The purpose of this letter is to bring this file up to date summarizing work conducted since July 2011 and reiterating work items that remain to be completed.

Underground Storage Tanks

On November 3, 2011, the underground oil storage tank was removed. At the time of removal, a second tank was discovered and removed along with visually impacted soil. The excavation was continued to groundwater where separate phase oil product was observed.

Based on recent communications with Antea Group staff working on behalf of Union Pacific Railroad, report preparation is in progress and submittal is anticipated in the next few weeks.

Shallow Soil Impacts

As previously stated, shallow soil impacts may be addressed prior to and/or during property development.

Soil Removal at SB-1

Soil removal in the area of SB-1 must be completed as soon as possible and prior to land development activities. The work may be conducted according to the existing work plan prepared by EBA Engineering submitted on behalf of the Railroad Square Associates, LLC (who is not a responsible party) or a new work plan. If someone other than EBA Engineering implements the existing work plan, the licensed professional in responsible charge of the project must be identified.

Based on the current development plans, a delay in completing remedial actions in the area of SB-1 may impact the installation of proposed infrastructure.

Extent of Groundwater Impacts

In addition to the soil removal project at SB-1, a work plan must be submitted to investigate the extent of groundwater impacts including the presence of separate phase oil at the former tank location, groundwater impacts in the area of SB-1, and clarify the relationship of on-site discharges and off-site impacts to the west beneath adjacent properties. The work plan is due within 45-days of issuance of this letter.

If you have any questions or would like to meet to discuss this case, I can be reached at (707) 576-2675 and Jfleck@waterboards.ca.gov.

Sincerely,

Joan Fleck
Engineering Geologist

Appendix B

Site Details and Summary of Previous Environmental Investigations

PREVIOUS INVESTIGATION AND SITE HISTORY SUMMARY

Over the history of environmental activities at the site, laboratories and consultants have used a wide variety of terms for petroleum hydrocarbons reported in analysis of soil and water. Soil and groundwater samples are analyzed typically by Environmental Protection Agency (EPA) method 8015B or 8260B. Antea Group uses the designation GRO for total petroleum hydrocarbons as gasoline within the C_5 to C_{10} carbon range, DRO for total petroleum hydrocarbons as diesel within the C_{10} to C_{28} carbon range, and RRO for total petroleum hydrocarbons as residual range organics (oil) within the C_{24} to C_{40} carbon range.

Terms from previous reports may include total recoverable petroleum hydrocarbons (TRPH), total purgeable petroleum hydrocarbons (TPPH) for GRO, total extractable petroleum hydrocarbons (TEPH) for DRO, and total volatile hydrocarbon (TVH) which refers to a broad carbon range. More specific historical terms are total petroleum hydrocarbons as gasoline (TPHg or TPH-G), total petroleum hydrocarbons as diesel (TPHd or TPH-D), and total petroleum hydrocarbons as oil or motor oil (TPHo, TPHmo, TPH-O, or TPH-MO). The designations are generally comparable to GRO, DRO, and RRO. Antea Group has left the original designation when summarizing historic data and the current designations when applied to recent investigations and summary discussions.

SITE HISTORY

In December 1987, Canonie Environmental Services Corporation (Canonie) removed three USTs from the site. These included a 230-gallon fuel oil UST, a 10,000-gallon diesel UST, and a 10,000-gallon gasoline UST, which were located within and northwest of the existing fenced enclosure. During UST removal activities, no holes or signs of leakage or overfilling were noted for any of the tanks. TPH were not detected above laboratory reporting limits in the soil samples collected from beneath the USTs (Industrial Compliance [IC], 1992).

In April 1990, the North Coast Regional Water Quality Control Board (RWQCB) drilled four borings in the western portion of the property and installed monitoring wells in two of the borings (MW-2 and MW-3). Monitoring well MW-3 was located approximately 100 feet down gradient (to the southwest) of the former fuel oil UST. Based on information presented in a July 1992 report by IC, analytical results for samples collected from the RWQCB borings showed that no petroleum hydrocarbons were present in soil samples collected from soil boring B-1. However, oil and grease was present in the soil sample collected from boring B-1 at 12 feet bgs at a concentration of 200 milligrams per kilogram (mg/kg). Additionally, this sample contained low concentrations of polynuclear aromatic hydrocarbons (PAHs). Soil samples collected at depths of 6 and 16 feet below ground surface (bgs) from soil boring MW-3 contained petroleum hydrocarbons quantified as diesel (TPHd) at concentrations of 11 and 30 mg/kg, respectively. No petroleum hydrocarbons were detected in the groundwater sample collected by the RWQCB from monitoring well MW-2; TPHd was detected at a concentration of 0.4 milligrams per liter (mg/l) in the groundwater sample collected at monitoring well MW-3 (Geomatrix Consultants, Inc. [Geomatrix], 2000).

Soil and grab groundwater samples were collected from five borings located near the former UST area by IC in 1992. No detectable concentrations of petroleum hydrocarbons, benzene, toluene, ethylbenzene, or xylenes

(BTEX compounds), or PAHs were reported in any of the soil samples collected. Grab groundwater samples collected from the location of the former diesel and gasoline USTs did not contain petroleum hydrocarbons or BTEX above laboratory reporting limits. The grab groundwater sample collected from the former fuel oil tank location reportedly contained TPHd at concentrations of 31 mg/l; no gasoline or BTEX compounds were detected in the grab groundwater sample collected from IC-B6 (Geomatrix, 2000).

The RWQCB destroyed monitoring wells MW-2 and MW-3 in June 1995. In November 1996, Geomatrix performed an investigation of soil and groundwater at the site to evaluate potential significant environmental impacts resulting from historical features or features identified during previous investigations and to respond to a request by the RWQCB to perform additional characterization in the vicinity of the former underground fuel oil tank. Twelve borings (SRB20 through SRB31) were drilled and samples were analyzed for TPHd, total petroleum hydrocarbons quantified as motor oil (TPHmo), PAHs, metals, and volatile organic compounds (VOCs). Soil samples collected for analyses of TPHd, PAHs, and metals were composited vertically from each boring; discrete samples subsequently were analyzed if elevated concentrations of constituents were detected. Only discrete samples were analyzed for VOCs. Petroleum hydrocarbons were detected in soil at elevated concentrations in boring SRB20 and SRB21, however the presence of petroleum hydrocarbons at these locations decreased with depth. Specifically, the shallower composite sample from SRB20 contained TPHmo at a concentration of 900 mg/kg. Discrete samples from depths of 4.0 and 6.5 feet contained TPHmo at concentrations of 69 mg/kg and less than 5 mg/kg, respectively. No TPHd was detected in soil samples from boring SRB20. In SRB21, TPHmo was present at a concentration of 510 mg/kg in the shallow composite sample; no TPHmo was detected in deeper, discrete samples from this boring. Shallow composite and deeper discrete soil samples from boring SRB21 contained TPHd, at a maximum concentration of 1,600 mg/kg. The concentration of TPHd in this boring decreased with depth and was not detected in the sample collected from 13.5 feet bgs (Geomatrix, 2000).

PAHs were detected in soil at concentrations below 1996 EPA screening criteria for industrial exposure. Concentrations of PAHs detected at this time are also below current PRGs (USEPA, 1999). For example, the maximum detected concentration of benzo(a)pyrene was 0.026 mg/kg in the discrete sample collected from a depth of 12.5 feet bgs in boring SRB22; the current PRG for benzo(a)pyrene is 0.29 mg/kg. The highest PAH concentration detected was in the discrete soil sample collected from a depth of 7 feet bgs in boring SRB22. In this sample, flourene was detected at a concentration of 0.87 mg/kg; the PRG for flourene is 33,000 mg/kg. Metals concentrations in soil were within expected background concentrations and less than 10 times the soluble threshold limit concentration (STLC)4 in all of the soil samples (discrete and composite). Concentrations of metals in soil samples also were below industrial PRGs. No TPHd, TPHmo, or VOCs were detected in groundwater above laboratory reporting limits. The results of the 1996 sampling program indicated no significant environmental issues at the site. However, based on its review of the results of the November 1996 work, the RWQCB requested that additional issues be addressed before case closure would be considered. These items, which are the focus of the work described herein, include additional evaluation of historical features, potential leachability of petroleum hydrocarbons, and groundwater quality at various site locations (Geomatrix, 2000).

In September 2001, five on-site and off-site groundwater monitoring wells were installed to characterize impacts to groundwater at the project site. A majority of wells were installed in the area of the aforementioned Santa Rosa Woolen Mills facility in the northwest portion of the project site. An up-gradient, single-screen monitoring well was installed on the eastern portion of the property in vicinity of the main line railroad tracks.

Extensive investigative activities were performed in 2002 on the northwest area of the project site at the historical location of the Santa Rosa Woolen Mills Facility. Soil samples collected as part of an investigation within this area reported significant concentrations of petroleum hydrocarbons present in soil and groundwater in the area of the fueling structures, the area of the former above ground fuel storage tank (AST), and the location of a former UST. Impacts to soil were identified as being primarily heavy range petroleum hydrocarbons. From June 2002 to November 2002, an additional characterization was performed in the northwestern area and a fenced enclosure at the property. Soil samples collected from these areas indicated significant concentrations of diesel and motor oil in soil. Proposed remedial options included excavation and removal of accessible impacted soil (EBA, 2008b).

In October and November 2003, approximately 6,500 cubic yards of impacted soil were removed from several areas of the project site. The most significant remediation efforts targeted the northwestern portion of the project site where several areas were excavated to remove impacted soil. Source removal activities began in the area of a former wooden UST that is indicated on historic Sanborn maps for the Santa Rosa Woolen Mills facility. During the excavation activities, remnants of the former UST were found and removed, whereupon the excavation was advanced to a total depth of approximately 18 feet bgs. A significant amount of free-phase petroleum hydrocarbon product was encountered on the groundwater surface during the excavation activities. The product and water was subsequently pumped, treated, and disposed of to the sanitary sewer. The excavation in this area, which resulted in the removal of approximately 700 cubic yards of impacted materials, proceeded to within 20 feet of the existing Sixth Street Warehouse and was subsequently terminated due to concerns of structure stability. Confirmation soil samples indicated that impacted materials containing significant concentrations of diesel and motor oil remained in place in the excavation sidewalls and groundwater in this area (EBA, 2008b).

Excavation activities in the northwestern portion of the property also included the removal off a fuel pipeline. The associated trench was enlarged as it encountered impacted materials in an area designated as the main pit excavation area. A total of 350 cubic yards of impacted materials were removed from this area. The excavation pit extended to depths below first encountered groundwater, which was encountered at approximately 19 feet bgs. The maximum depth attained by the excavation was approximately 22 feet bgs. Impacted groundwater encountered within the excavation pit, which included free-phase petroleum hydrocarbon product, was subsequently removed using pumps, treated, and disposed of to the sanitary sewer (EBA, 2008b).

Additional excavation was also performed on the south side of the aforementioned product line trench in the northwestern area. Approximately 325 cubic yards of impacted soil was removed from this area. Approximately 270 cubic yards of impacted soil was excavated and removed in the southwestern side of the project site identified as the “southern warehouse area” (EBA, 2008b).

Quarterly groundwater monitoring performed in the northwestern portion of the project site property and west into the neighboring property parcel indicated low levels of petroleum hydrocarbons in a monitoring well identified as SRMW-13 located in the northwest corner of the property. In addition, the fuel oxygenate methyl tert-butyl ether (MTBE) was detected in SRMW-8 located on the northeast side of the property. The remaining monitoring wells appear to have been relatively free of impacts during the time monitored (EBA, 2008b).

The RWQCB issued a *No Further Action* (NFA) letter for the previous case at the site on August 31, 2007. In 2008, Sonoma Marin Area Rail Transit District (SMART) granted an option to purchase the site, formerly owned by Northwestern Pacific Railroad Authority (NWRPA) to New Railroad Square Associates, LLC for transit-oriented development purposes. In anticipation of property ownership for the site, New Railroad Square Associates, LLC (with consent from SMART) contracted the services of EBA Engineering (EBA) to perform environmental assessment activities. EBA's November 2008 *Comprehensive Report on Findings* concluded that on-site hazardous materials presently exist at various locations on the property. These materials include an underground oil storage tank (UST), heavy hydrocarbon soil and groundwater impacts in the vicinity of soil boring SB-1, and impacted shallow soil across the site. The RWQCB reopened the environmental case for the site on January 16, 2009 based on EBA's findings.

In a letter dated February 4, 2011, the RWQCB directed UPRR to remove the oil UST on the property. In November 2011, United Pumping Services (UPS) removed the UST as directed. However, during the initial day-lighting activities of the oil UST, an additional 500-gallon UST containing oil was discovered adjacent and west of the known tank. UPS evacuated, cleaned, and removed the second UST in conjunction with the known UST. UPS excavated and disposed of approximately 213.03 tons of impacted soil surrounding the USTs, and pumped approximately 500 gallons of oil impacted groundwater from the excavation. Antea Group collected 16 soil samples and one grab groundwater sample from within the excavation. Based on the distribution of MORO, DRO, VOCs, and PAHs, it appears that a release from the removed USTs only affected the immediate soils surrounding the USTs. Sidewall samples NWB and SWB collected at 15 feet bgs reported concentrations of VOCs and PAHs not found in any other (shallower) samples collected. From the available data, soil VOCs and PAHs impacts appear to be the result of impacted groundwater within the capillary fringe, originating from outside of the excavated area, and not due to a release from the USTs at that location.

SENSISTIVE RECEPTORS

Geomatrix performed a well survey in 2000. Domestic and industrial water supply for the site vicinity is provided through the City of Santa Rosa, which purchases water from the Sonoma County Water Agency (SCWA). The SCWA delivers water to the City via the Sonoma County aqueduct. The source of the water is the Russian River, which is fed by three main upstream reservoirs. The City of Santa Rosa also has eight standby wells to pump groundwater for emergency purposes; these wells currently are not in use (Geomatrix, 2003).

Information provided by the City of Santa Rosa Utilities Department (SRUD) indicates that 50 groundwater wells are located within a half mile of the site. Of these wells, 21 are located within a half mile generally to the north (hydraulically up- and cross-gradient of the site) and 29 are located within a half mile generally to the south (hydraulically down-gradient of the site). Of the 50 wells, only four are located within a one-quarter mile radius, with two wells located approximately up gradient and two approximately down gradient. Based on conversations with SRUD personnel, only two of the residences located within one-half mile from the site are not connected to the City of Santa Rosa water supply. These residences are located at 654 and 658 Dutton Avenue. Uses for the wells are not tracked by SRUD in all cases, but records indicate that the wells within one-quarter mile of the site are used for irrigation and external use (Geomatrix, 2003).

Information about the possible presence of an additional water producing well located near the site was provided by the RWQCB. This well was not included in the SRUD database. The well is located to the west of the site between the site and Santa Rosa Creek; its actual location has not been field-verified. At this time the well is not in use, and based on a conversation with the site redeveloper, the well will not be used in the future and will be appropriately destroyed (Geomatrix, 2003).

1.0 INTRODUCTION

EBA Engineering (EBA) has contracted with Railroad Square Associates LLC (Client) to prepare this Soil Excavation Work Plan (Work Plan) in relation to the proposed redevelopment of the Sonoma Marin Area Rail Transit (SMART) property located in Santa Rosa, California. The scope of work includes the excavation and disposal of soil impacted by petroleum hydrocarbons and the select sampling of soil for chemical analysis. The proposed work addresses recommendations outlined in EBA's November 2008 *Report of Findings* (EBA, 2008b), which were subsequently approved by the North Coast Regional Water Quality Control Board (NCRWQCB) in their letter dated January 16, 2009.

2.0 BACKGROUND

2.1 Project Site Description and History

The seven-acre project site consists of two contiguous parcels of land identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-003 (34 Sixth Street). The project site currently consists of a former railroad yard located in a historic district of downtown Santa Rosa. The properties are bounded on the south by Third Street, on the west by former commercial properties identified herein as the 3 West Third Street and 60 West Sixth Street Warehouses, on the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties, including Aroma Roasters and Hotel La Rose. Santa Rosa Creek is located approximately 160 feet west of the western project site boundary, on the west side of the adjacent commercial properties. Please refer to Figure 2, Appendix A for an illustration of the general features for both the project site and adjacent properties.

Research suggests the project site was used as a railroad freight depot and maintenance/fueling yard from the late 1800's up until the 1960's. Historically, site structures included the main line track system that occupied the eastern side of the property, several associated railroad spurs and siding, a turntable, warehouses and freight houses. Multiple aboveground and underground fuel and water tanks were located throughout the property. Additionally, a Sanborn Fire Insurance map dated 1885 indicates the Santa Rosa Woolen Mills, which operated until 1906, was located in the northwestern portion of the project site.

Presently, the northern portion of the project site contains rough access ways, fencing, and waste lumber. The San Francisco and North Pacific Railroad line right-of-way and associated tracks trend along the eastern boundary of the project site. A freight house lies along the railroad tracks in the south-central portion of the property. The southern portion of the project site has several north-south trending railroad tracks, which disperse throughout the property as spur and main line tracks. Existing utilities include a sanitary sewer line, which trends axially northward from Third Street to Sixth Street and is fed by tie-ins from both Fourth and Fifth Streets. Both Fourth and Fifth Streets also have storm drains, which extend across the project site and terminate at Santa Rosa Creek to the west.

2.2 Project Site Investigation and Remediation Activities

Environmental investigation and remediation efforts have been conducted at the project site from the late 1980's up until the present. Previous efforts have included the removal of underground storage tanks (USTs), soil and groundwater sampling, and excavations. A substantial amount of this work is summarized in the March 2008 *Phase I Environmental Site Assessment* (EBA, 2008a). A brief list of previous remediation efforts which more directly affect the extent of this work plan, and where that work occurred, is provided as follows:

- Extensive investigative activities were performed in the northwest area of the project site at the historic location of the Santa Rosa Woolen Mills facility, which operated in this area from the late 1800's until it was destroyed by fire in the 1906 earthquake. After this time, the area was utilized by the railroad for various uses including fuel storage and fueling operations. Soil samples collected during the investigation of structures within this area indicated significant concentrations of petroleum hydrocarbons present in soil and groundwater in the area of the fueling structures, the area of the former aboveground fuel storage tank, and the location of a former UST. Impacts to soil were identified as being primarily heavy range petroleum hydrocarbons.

- In September 2001, five on-site and off-site groundwater monitoring wells were installed to characterize impacts to groundwater at the project site. A majority of the monitoring wells were installed in the area of the aforementioned Santa Rosa Woolen Mills facility in the northwest portion of the project site. An upgradient, single-screen monitoring well was installed on the eastern portion of the property in the vicinity of the main line railroad tracks.

- From June 2002 to November 2002, an additional characterization was performed in the northwestern area and a fenced enclosure at the property. Soil samples collected from these areas indicated significant concentrations of diesel and motor oil in soil. Proposed remedial options included excavation and removal of accessible impacted soil.

- In October and November 2003, approximately 6,500 cubic yards of impacted soil were removed from several areas of the project site. The most significant remediation efforts targeted the northwestern portion of the project site where several areas were excavated to remove impacted soil. Source removal activities began in the area of a former wooden UST that is indicated on historic Sanborn maps for the Santa Rosa Woolen Mills facility. During the excavation activities, remnants of the former UST were found and removed and excavation proceeded to depths of approximately 18 feet below ground surface (BGS). Significant amounts of free phase petroleum hydrocarbons were encountered on the groundwater surface during the excavation activities that were subsequently pumped, treated and disposed of to the sanitary sewer. The excavation in this area, which resulted in the removal of approximately 700 cubic yards of impacted materials, proceeded to within 20 feet of the existing Sixth Street Warehouse and was subsequently stopped due to concerns of stability of the structure. Confirmation soil samples indicated that impacted materials containing significant concentrations of diesel and motor oil remained in place in excavation sidewalls and groundwater in this area.

- Excavation activities in the northwestern portion of the property also included the removal of a fuel pipeline. The associated trench was enlarged as it encountered impacted materials in an area designated as the main pit excavation area. A total of 3,500 cubic yards of impacted materials were removed from this area. The excavation pit extended to depths of first encountered groundwater at approximately 19 feet BGS. Impacted groundwater was encountered with free phase petroleum hydrocarbons present. The impacted groundwater was removed using pumps, treated, and disposed of to the sanitary sewer. Excavation activities were performed below groundwater to a final depth of approximately 22 feet BGS.

- Approximately 270 cubic yards of impacted soil was excavated and removed in the southwestern side of the project site identified as the southern warehouse area.

- Additional excavation was also performed on the south side of the aforementioned product line trench in the northwestern area. Approximately 325 cubic yards of impacted soil was removed from this area.

- Quarterly groundwater monitoring performed in the northwestern portion of the project site property and west into the neighboring property parcel indicated low levels of petroleum hydrocarbons in monitoring well SRMW-13 located in the northwest corner of the property. The fuel oxygenate methyl tert-butyl ether (MtBE) was detected in monitoring well SRMW-8 located on the northeast side of the property. The remaining monitoring wells appear to have been relatively free of impacts during the time monitored.

- During September and October, 2008, EBA conducted a subsurface investigation at the project site. The scope of work included the performance of a geophysical survey, preliminary assessment of suspect areas, advancement of 80 soil borings, and the collection of soil and groundwater samples for chemical analysis. Significant concentrations of petroleum hydrocarbons were detected in soil and groundwater in the vicinity of soil boring SB-1A to a depth of approximately 14 feet BGS. The soil and groundwater sample analytical results collected during this investigation are included as Appendix B. Further details regarding this investigation are available in EBA's *Report of Findings* (EBA, 2008b).

3.0 GEOLOGY AND HYDROGEOLOGY

3.1 Regional Geology

The project site is centrally located within the Santa Rosa Plain, which is part of the Coast Range Geomorphic Province of northern California. The Coast Range Geomorphic Province is generally characterized as a series of northwest trending elongated ridges and valleys that are a result of folding and faulting. The Santa Rosa Plain, in turn, consists of alluvial fan deposits of Pleistocene and Holocene age. The alluvial fan deposits form a nearly continuous blanket over

the Santa Rosa Plain and consist of poorly sorted coarse sand and gravel, moderately sorted fine sand and silt, and silty clay. The region of the project site has been mapped as having basement materials that underlie the alluvial fan deposits. The basement materials consist of marine sedimentary rocks of the Miocene Age Wilson Grove Formation. Portions of the Wilson Grove Formation are overlain in places by younger continental sedimentary rocks of the Pliocene-Pleistocene Age Glen Ellen Formation (Cardwell, 1958).

3.2 Project Site Geology and Hydrogeology

The geology of the project site is generally characterized by shallow (one to two feet BGS) rocky fill underlain by various lithologies including sandy silt and clayey sediments that contain varying amounts of angular to sub-rounded gravel. These finer-grained sediments extend to approximately 20 feet BGS, and are underlain by a laterally continuous coarser grained unit, defined in general as sand by cone penetration testing (CPT), which extends to at least 25 feet BGS, the maximum depth explored at the project site to date.

The hydrogeology of the project site is likely controlled by aggradational packages of sediments separated by clayey layers. At an average depth of approximately 13 to 15 feet BGS, a thin, laterally extensive sandy unit overlays a similarly laterally extensive clayey bed. This more impervious underlying clay likely acts as a confining layer and inhibits the vertical migration of fluids. Based on this characteristic, the resulting perched groundwater in the more permeable sandy unit at 15 feet BGS was independently sampled from the deeper water-bearing zone that is present at approximately 20 to 25 feet BGS.

Historical groundwater monitoring has indicated the predominant groundwater flow direction to be approximately west-southwest across the project site, towards Santa Rosa Creek. As a result, the eastern portion of the project site is upgradient relative to the western portion.

4.0 PROPOSED SCOPE OF WORK

The proposed scope of work will entail the removal of petroleum hydrocarbon impacted soil from the project site in the area of former soil boring SB-1. It is anticipated that the excavation will proceed laterally to the limits depicted on Figure 2 (Appendix A) of this Work Plan with final vertical limits of approximately 15 feet BGS, which is at or below the anticipated depth to groundwater. As shown on Figure 2, the lateral extent of the soil excavation is anticipated to measure approximately 45 feet by 15 feet. The total in-place volume of soil proposed for excavation is approximately 375 cubic yards. The rationale for the proposed lateral and vertical limits of the excavation are based on analytical results of soil samples collected from soil borings SB-1A through SB-1F. Please refer to Appendix B for tabulated soil sample analytical results.

The excavation activities will be performed by a properly licensed excavation contractor under the direct supervision of EBA. During the excavation activities, the breathing zone and surrounding vicinity will be monitored for health and safety purposes using a photoionization detector (PID). Results of the site monitoring will be recorded on field notes and be available

upon request. The following subsections outline the methodologies that will be used during the removal of the petroleum hydrocarbon impacted soil from the project site.

4.1 Permitting and Utility Clearance

A permit for soil remediation will be forwarded to the Santa Rosa Fire Department (SFRD) for approval and a grading permit will be obtained from the Santa Rosa Community Development Department. Notification will also be made to the Bay Area Air Quality Management District prior to excavation activities. Prior to the start of excavation activities, the project site will be marked for Underground Service Alert (USA).

4.2 Confirmation Soil Sample Collection

When observation and field screening procedures indicate that petroleum hydrocarbon impacted soil has been removed, EBA will collect confirmation soil samples at a frequency of one sample per 100 square feet of pit bottom and sidewall. Additional soil samples may be collected at the direction of the NCRWQCB and/or the SRFD. Soil samples selected for the analysis of volatile organic compounds (VOCs) will be collected in accordance with EPA Method 5035 using Encore® samplers. All sample containers will be capped, labeled and placed under refrigerated conditions pending transport under Chain-of-Custody protocols to K Prime, Inc., a State-certified laboratory, for chemical analysis.

4.3 Groundwater Management and Disposal

Groundwater that is encountered during the excavation activities will be pumped from the excavation and containerized on-site in a temporary storage tank. Groundwater samples will be collected from the tank and/or the excavation pit and analyzed for the constituents listed below in Subsection 4.6. Results from the groundwater sampling will be used in subsequent mass contaminant removal estimates. The containerized groundwater will then be treated with granular activated carbon (GAC) and discharged to the sanitary sewer under permit from the City of Santa Rosa Industrial Waste Department.

4.4 Soil Management and Disposal

The soil that is removed during soil excavation activities will be placed on, and covered with, plastic sheeting on-site pending chemical analysis. The soil will subsequently be loaded and hauled under manifest for disposal to a permitted solid waste disposal facility.

4.5 Backfill and Compaction

Following approval from the NCRWQCB and SRFD, the excavation will be backfilled with clean imported fill. The backfill material will be placed in lifts and the final five feet BGS will be compacted to 90 percent of the maximum dry density

4.6 Laboratory Testing

Each soil and groundwater sample retained for chemical analysis will be analyzed for Total Petroleum Hydrocarbons as diesel (TPH-d) and as motor oil (TPH-mo) using EPA Method 8015. Selected soil samples may also be analyzed for VOCs using EPA Method 8260 and California Assessment Manual (CAM) 5 metals (cadmium, chromium, lead, nickel and zinc) using EPA Method 6000/7000 series.

5.0 REPORT OF FINDINGS

A Report of Findings (Report) will be prepared upon completion of the fieldwork. The Report will document the work performed and corresponding conclusions and recommendations will be summarized. Specifically, recommendations will be presented addressing the necessity for further investigative or corrective action work in the vicinity of SB-1. In addition, summary tables of analytical results will be presented and copies of the corresponding Certified Analytical Reports will be appended to the Report.

6.0 SITE HEALTH AND SAFETY PLAN

A Site Health and Safety Plan for the scope of work presented herein is enclosed in Appendix B.

7.0 SCHEDULE

Work will commence following NCRWQCB and SRFD review and approval of this Work Plan and at the direction of the Client.

Geoprobe® CPT and UVOST Product Summaries

CPT

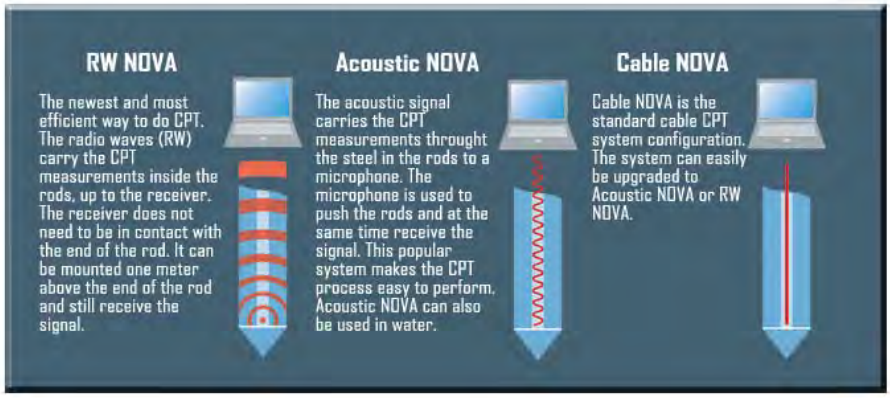
The new NOVA CPT equipment integrates easily with the Geoprobe® 6622CPT machine which was designed specifically for pushing CPT, as well as having standard Geoprobe® direct push sampling capabilities using a hydraulic percussion hammer. Using RW (Radio Wave) NOVA, the user can push cones through the center chuck system while collecting cordless cone data real-time via a RW antenna. Communication between the cone and data acquisition is automatic. By integrating these two major components, expect to see improved efficiency in CPT. Setup and pushing capability will be easier for CPT soundings using the 6622CPT with automatic anchor placement, wireless remote control for tracks, throttle, & rear blade, and center pushing through a CPT clamp system. NOVA CPT adds to the advancements by offering two cordless options for operators where data can be acquired at 18-bit resolution through either RW or sound data transmission approaches.

Geoprobe Systems® teamed up with Geotech AB of Sweden to be the exclusive US distributor for Geotech AB Cone Penetration Testing tools for geotechnical and environmental studies. Now it is possible to combine the efficiency of Geoprobe® technology (lightweight, mobile) with the innovative cone penetration technique. These cordless CPT probes can be used from a variety of push platforms to provide continuous data, repeatable penetration results, and cost savings over more traditional boring and sampling methods. A CPT test is commonly used to determine the subsurface statigraphy in situ (in place) and to estimate geotechnical parameters of the materials present. The Geotech NOVA CPT system is unique in the geotechnical industry for its cordless data transmission system: a constant stream of data is sent to the surface through the soundingrods. No cable through the rods is needed.

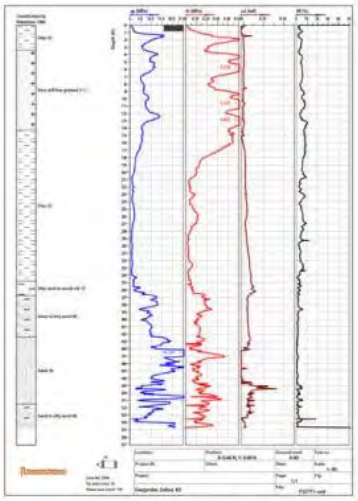
Basic components of the RW NOVA CPT System (clockwise from the left): Instrumentation Cords, Depth Encoder, Computer Interface, RW NOVA Receiver, and RW NOVA Transmitter assembled to the NOVA CPT Probe.

Cone meets the ASTM D-5778 Standard Test Method for Performing Electronic Friction Cone and Piezocone Penetration Testing of Soils.

New cordless cone and data transmission technology makes logging quicker and easier!

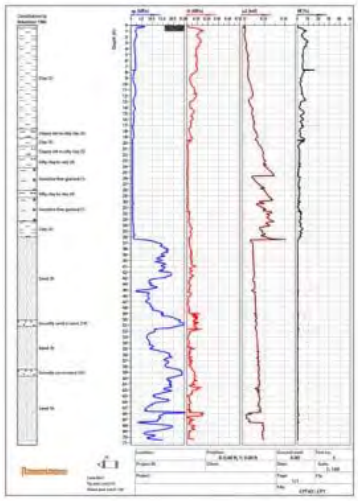


- This only CPT probe industry-wide that provides a constant stream of real-time data while you're probing... without a cord downhole. Information collected includes soil resistance on the cone tip, resistance on the outer sides, and pore pressures generated during the test.
- The only data transmission system of its kind.
- The operator does not have to manage data cable as the rods are cycled in and out of the sounding hole. Rod handling is efficient and the risk of cable damage is eliminated.
- New, RW NOVA technology uses radio waves to transmit measurements back to the receiver, opening the door for cordless SCPT, downhole video camera capabilities, and other data collecting sensors.
- Data transmission methods: Acoustic NOVA, Cable NOVA, RW NOVA
- New cone design offers 18 bit resolution with improved strength and gauge measurement accuracy.
- Repeatable penetration results
- Since the rod bore is free and clear, it can be used for lubrication grouting as the rods are pushed into the ground and for retraction grouting (hole sealing) as the rods are pulled. Click here for a drawing of this feature.



Make sure you use the best machine when running CPT logs. The 6622CPT machine has the ability to anchor up to 16in. (406 mm) in diameter. This

- Can be used with multiple push platforms: drill rigs, cone trucks, Geoprobe® direct push machines....
- Interpret results quickly with user-friendly CPT-PRO software for comprehensive data evaluation.



can be used for stabilizing the machine during a logging or sampling event.

Laser Induced Fluorescence (UVOST)

Gregg Drilling conducts Laser Induced Fluorescence (LIF) Cone Penetration Tests using a UVOST module that is located behind the standard piezocone, *Figure UVOST*. The laser induced fluorescence cone works on the principle that polycyclic aromatic hydrocarbons (PAH's), mixed with soil and/or groundwater, fluoresce when irradiated by ultra violet light. Therefore, by measuring the intensity of fluorescence, the lateral and vertical extent of hydrocarbon contamination in the ground can be determined.

The UVOST module uses principles of fluorescence spectrometry by irradiating the soil with ultra violet light produced by a laser and transmitted to the cone through fiber optic cables. The light is then passes through a small window in the side of the cone into the soil. Any hydrocarbon molecules present in the soil absorb the light energy during radiation and immediately re-emit the light at a longer wavelength. This re-emission is termed fluorescence. The UVOST system also measures the emission decay with time at four different wavelengths (350nm, 400nm, 450nm, and 500nm). This allows the software to determine a product "signature" at each data point. This process allows determination of the type of contaminant as shown in Figure *Concept*.

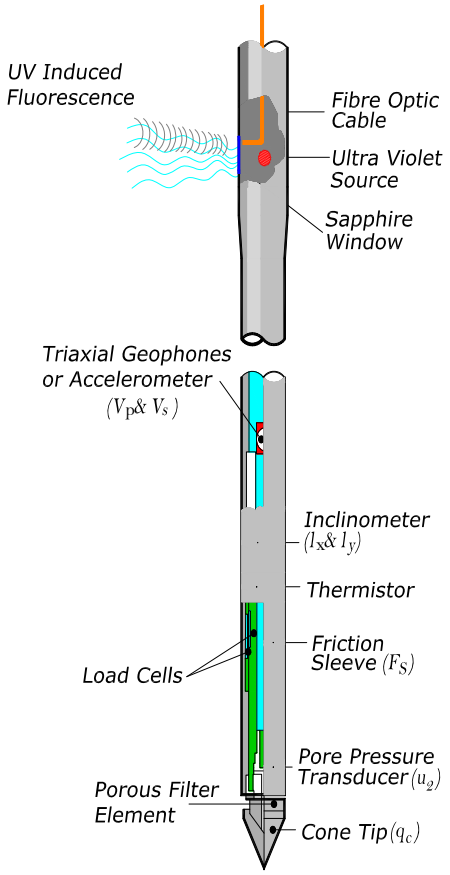

Figure UVOST: UVOST system deployed with the CPT

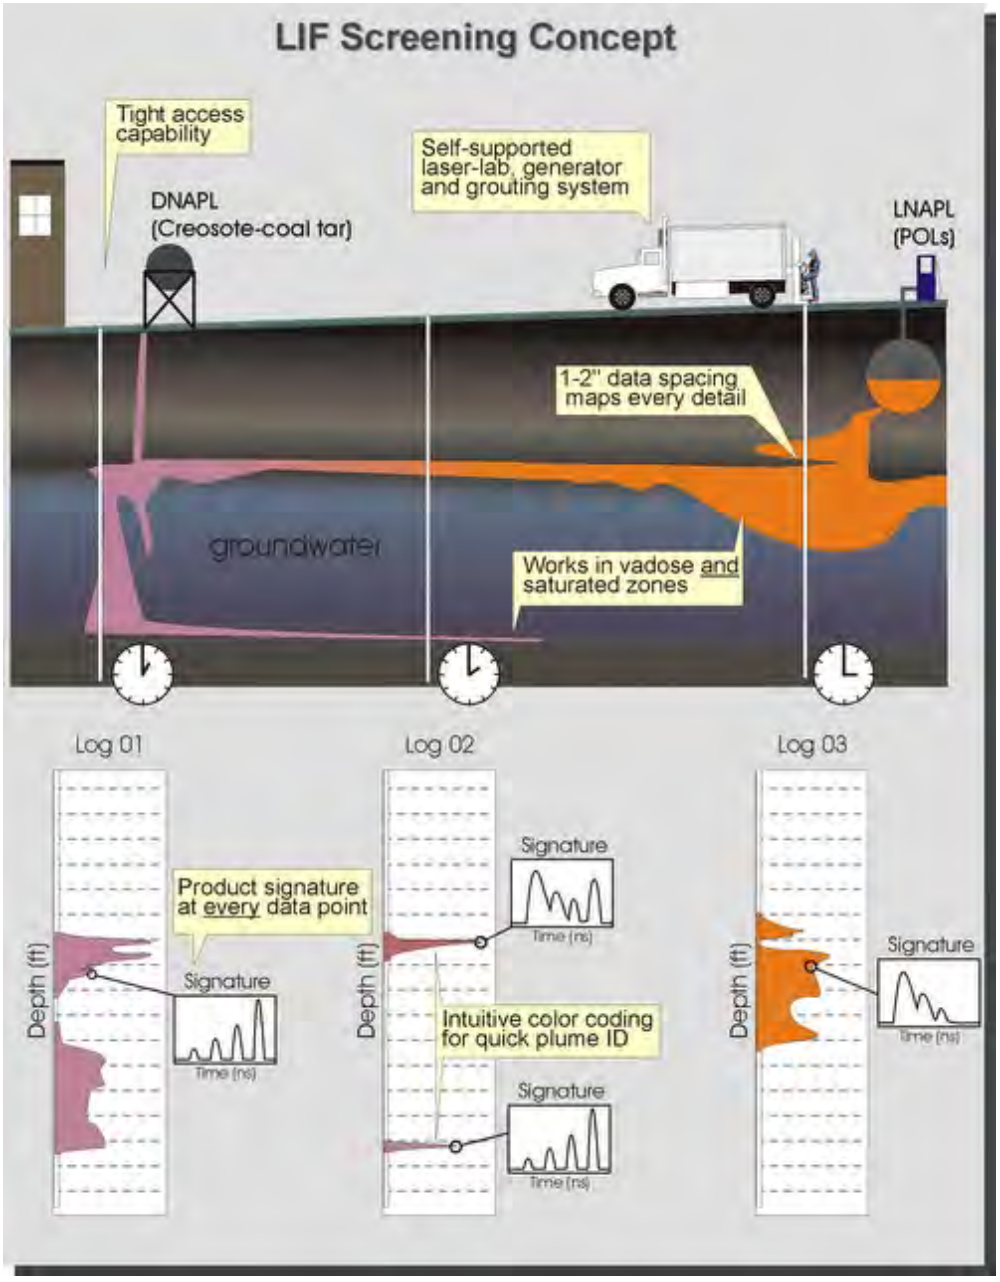
In general, the typical detection limit for the UVOST system is <100 ppm and it will operate effectively above and below the saturated zone. With the capability to push up to 600 feet per day, laser induced fluorescence offers a fast and efficient means for delineating PAH contaminant plumes. Color coded logs offer qualitative information in a quick glance and can be produced in the field for real-time decision making. Coupled with the data provided by the CPT, a complete site assessment can be completed with no samples or cuttings, saving laboratory costs as well as site and environmental impact.



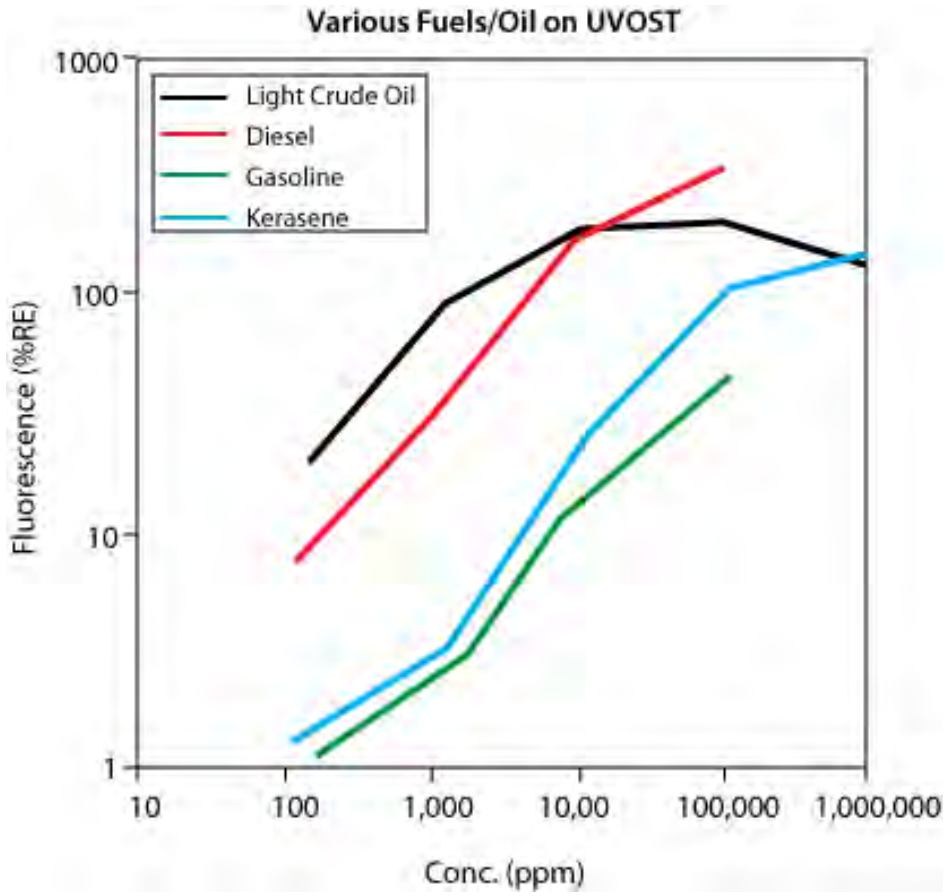


Figure Concept (figure provided by Dakota Technologies)

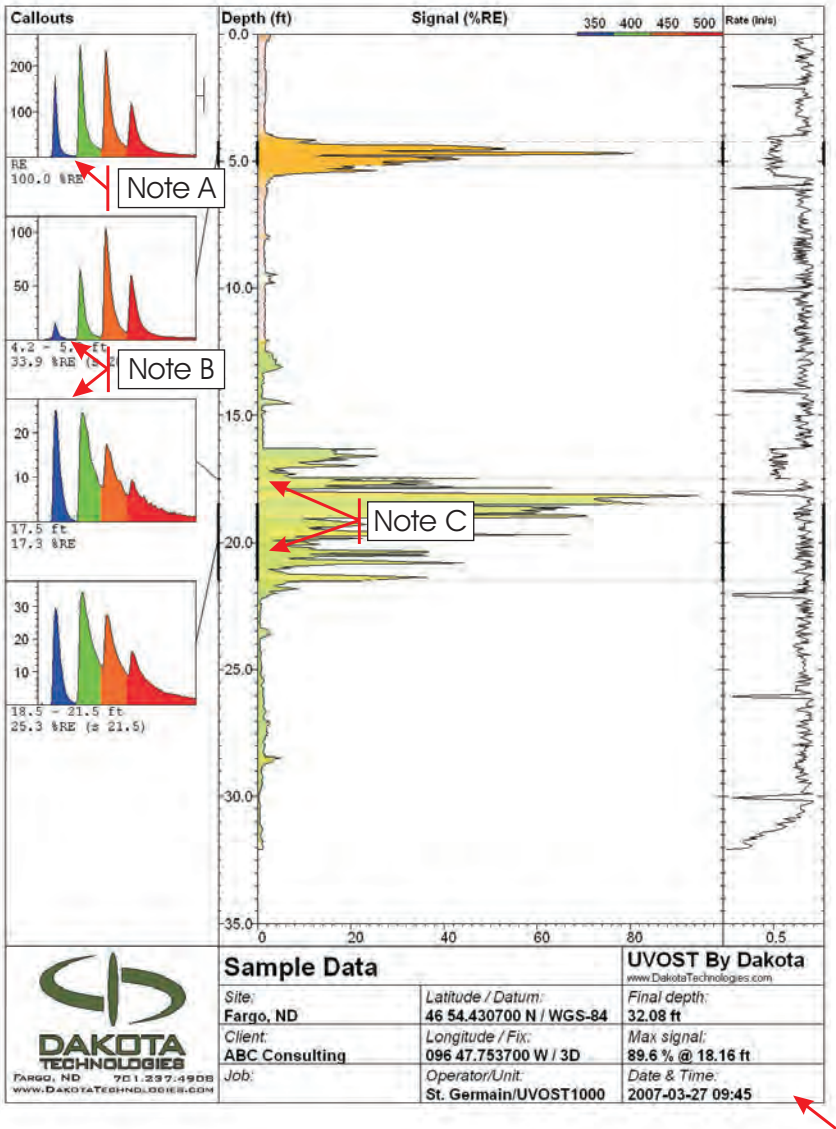
Hydrocarbons detected with UVOST	Hydrocarbons rarely detected using UVOST
Gasoline	Extremely weathered gasoline
Diesel	Coal tar
Jet (Kerosene)	Creosote
Motor Oil	Bunker Oil
Cutting fluids	Polychlorinated bi-phenols (PCB's)
Hydraulic fluids	Chlorinated solvent DNAPL
Crude Oil	Dissolved phase (aqueous) PAH's

Potential False Positives (fluorescence observed)	**Potential False Negatives** (do not fluoresce)
Sea-shells (weak-medium)	Extremely weathered fuels (especially gasoline)
Paper (medium-strong depending on color)	Aviation gasoline (weak)
Peat/meadow mat (weak)	Coal tars (most)
Calcite/calcareous sands (weak)	Creosotes (most)
Tree roots (weak-medium)	"Dry" PAHs such as aqueous phase, lamp black, purifier chips
Sewer lines (medium-strong)	Most chlorinated solvents
	Benzene, toluene, zylenes (relatively pure)

Dakota Technologies
UVOST Log Reference



Main Plot :
Signal (total fluorescence) versus depth where signal is relative to the Reference Emitter (RE). The total area of the waveform is divided by the total area of the Reference Emitter yielding the %RE. This %RE scales with the NAPL fluorescence. The fill color is based on relative contribution of each channel's area to the total waveform area (see callout waveform). The channel-to-color relationship and corresponding wavelengths are given in the upper right corner of the main plot.

Callouts :
Waveforms from selected depths or depth ranges showing the multi-wavelength waveform for that depth.

The four peaks are due to fluorescence at four wavelengths and referred to as “channels”. Each channel is assigned a color.

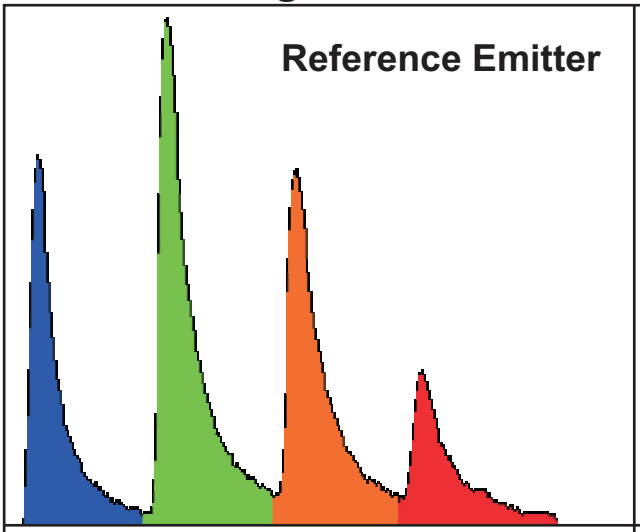
Various NAPLs will have a unique waveform "fingerprint" due to the relative amplitude of the four channels and/or broadening of one or more channels.

Basic waveform statistics and any operator notes are given below the callout.

Rate Plot :
The rate of probe advancement. ~ 0.8in (2cm) per second is preferred.

A noticeable decrease in the rate of advancement may be indicative of difficult probing conditions (gravel, angular sands, etc.) such as that seen here at ~5 ft.

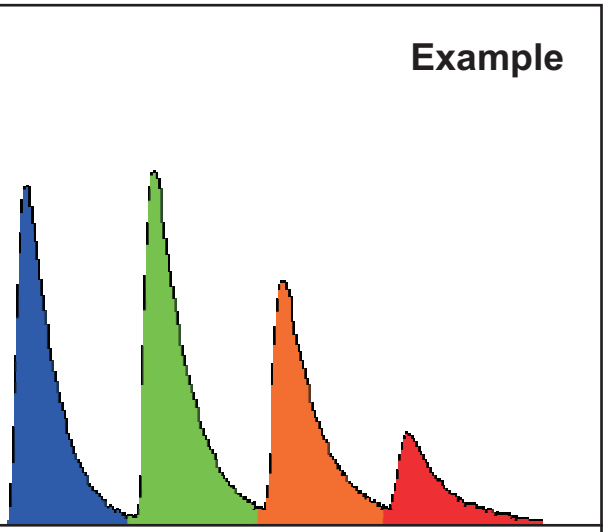
Notice that this log was not terminated arbitrarily, but due to "refusal", as indicated by the sudden advancement rate drop at final depth.



Info Box :
Contains pertinent log info including name and location.

Note A :
Time is along the x axis. No scale is given, but it is a consistent 320ns wide.
The y axis is in mV and directly corresponds to the amount of light striking the photodetector.

Note B :
These two waveforms show two different products, each with a unique waveform. The first is used motor oil and the second is diesel.

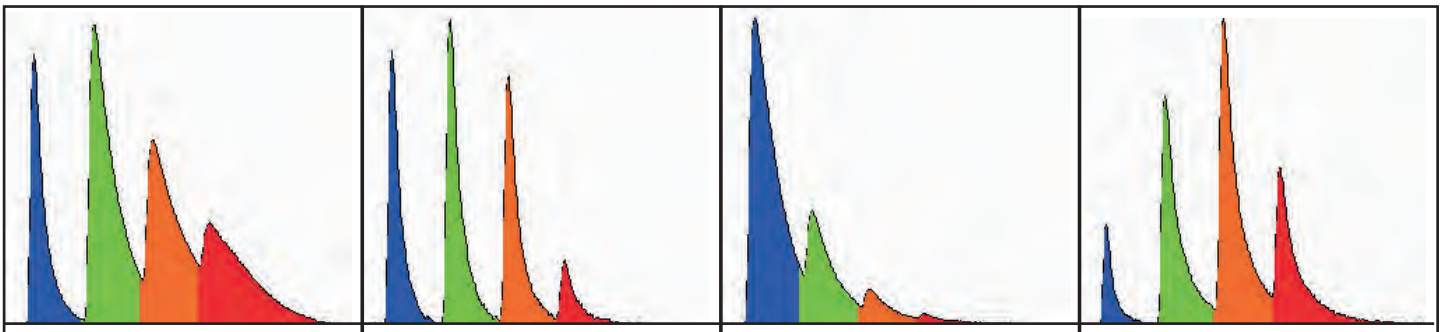


Note C :
Callouts can be a single depth (see 3rd callout) or a range (see 4th callout). The range is noted on the depth axis by a bold line. When the callout is a range, the average and standard deviation in %RE is given below the callout.

Waveform Signal Calculation

CH1		CH2		CH3		CH4		Total
4820	+	8108	+	6249	+	2984	=	**22161**
21.7		36.6		28.2		13.5		**100%**

Channel Area (pVs) Percent RE



CH1		CH2		CH3		CH4		Total
4923	+	5743	+	4166	+	1735	=	**16587**
22.3		25.9		18.8		7.8		**75%**

Data Files

***.lif.raw.bin**	Raw data file. Header is ASCII format and contains information stored when the file was initially written (e.g. date, total depth, max signal, gps, etc., and any information entered by the operator). All raw waveforms are appended to the bottom of the file in a binary format.
***.lif.plt**	Stores the plot scheme history (e.g. callout depths) for associated Raw file. Transfer along with the Raw file in order to recall previous plots.
***.lif.jpg**	A jpg image of the OST log including the main signal vs. depth plot, callouts, information, etc.
***.lif.dat.txt**	Data export of a single Raw file. ASCII tab delimited format. No string header is provided for the columns (to make importing into other programs easier). Each row is a unique depth reading. The columns are: Depth, Total Signal (%RE), Ch1%, Ch2%, Ch3%, Ch4%, Rate, Conductivity Depth, Conductivity Signal. Summing channels 1 to 4 yields the Total Signal.
***.lif.sum.txt**	A summary file for a number of Raw files. ASCII tab delimited format. The file contains a string header. The summary includes one row for each Raw file and contains information for each file including: the file name, gps coordinates, max depth, max signal, and depth at which the max signal occured.
***.lif.log.txt**	An activity log generated automatically located in the OST application directory in the 'log' subfolder. Each OST unit the computer operates will generate a separate log file per month. A log file contains much of the header information contained within each separate Raw file, including: date, total depth, max signal, etc.

Common Waveforms (highly dependent on soil, weathering, etc.)

Diesel	Gas	Kerosene	Motor Oil

Site Remedial Action and Investigation Report

Union Pacific Railroad
2 Fourth Street and 34 Sixth Street, Santa Rosa, California
North Coast Regional Water Quality Control Board Case No. 1TSR196

1.0 INTRODUCTION

Antea™Group has prepared this *Site Remedial Action and Investigation Report* on behalf of Union Pacific Railroad (UPRR) in response to the North Coast Regional Water Quality Control Board (RWQCB) directive letter dated January 19, 2012 and work plan approval letter dated March 19, 2012 **(Appendix A).** This report summarizes the following activities to address RWQCB concerns:

- additional soil excavation in the vicinity of EBA Engineering (EBA) boring SB-1,
- qualitative groundwater assessment in the vicinity of the recently removed underground storage tanks (USTs) to investigate the extent of separate phase hydrocarbons (SPH) encountered during UST removal;
- to determine the optimal placement of up to four groundwater monitoring wells, and
- the advancement of twelve soil borings (B1 through B12) along a section of the southwest property boundary to aid in determining the relationship between on-site and off-site contamination.

1.1 Site Description

Currently, the site is being used as a construction equipment supply storage area for Sonoma Marin Area Rail Transit (SMART) construction activities taking place off site. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the 3 West Third Street and 60 West Sixth Street Warehouses, to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties (**Figure 1**).

1.2 Site History

The site was historically used as a railroad freight depot and maintenance/fueling yard from the late 1800's through the 1960's. This site has been vacant and generally unused since the late 1960's. Consultants have conducted environmental investigations and remediation efforts at the site since 1987. Former operations at the site include the use of aboveground storage tanks (ASTs), underground storage tanks (USTs), a main railroad track system that occupied the eastern portion of the property, several associated railroad spurs and siding, a turntable, warehouses, and freight houses. A Sanborn Fire Insurance map dated 1885 indicates the Santa Rosa Woolen Mills was located in the northwestern portion of the site until approximately 1906 (EBA, 2009a). **Appendix B** includes a summary of environmental investigations and remedial activities conducted at the site. **Figure 2** shows the locations of historic borings and wells at the site.

1.3 Geologic and Hydrogeologic Setting

1.3.1 Regional Geology

The site is centrally located within the Santa Rosa Plain, which is part of the Coast Range Geomorphic Province of northern California. The Coast Range Geomorphic Province is characterized as a series of northwest trending elongated ridges and valleys that are a result of folding and faulting. The Santa Rosa Plain consists of alluvial fan deposits of Pleistocene and Holocene age. The alluvial fan deposits form a nearly continuous blanket over the Santa Rosa Plain and consist of poorly sorted coarse sand and gravel, moderately sorted fine sand and silt, and silty clay. The region has been mapped as having basement materials that underlie the alluvial fan deposits. The basement materials consist of marine sedimentary rocks of the Miocene Age Wilson Grove Formation. Portions of the Wilson Grove Formation are overlain by younger continental sedimentary rocks of the Pliocene-Pleistocene Age Glen Ellen Formation (EBA, 2008b).

1.3.2 Site Geology and Hydrogeology

The geology of the project site is characterized by shallow rocky fill or organic clay in the upper one to two feet below ground surface (bgs) that is underlain by sandy silt and clayey sediments containing varying amounts of angular to sub-rounded gravel. These finer-grained sediments extend to approximately 20 feet bgs, and are underlain by a laterally continuous sandy coarse-grained unit extending to at least 26 feet bgs, the maximum depth explored at the project site to date (EBA, 2008b).

The hydrogeology of the project site is likely controlled by gradational lenses of sediments separated by clayey layers. A thin, semi-continuous sandy unit located at an average depth of approximately 9-15 feet bgs overlays a similarly laterally extensive clayey bed. The more impervious clay units likely act as confining layers and inhibit the downward vertical migration of fluids. Based on this observation, the resulting perched groundwater in the upper permeable sand unit (Zone A) has been independently sampled from the deeper water-bearing zone present at a depth of approximately 20 to 25 feet bgs (EBA, 2008). However, EBA noted that wells SRMW-7 and SRMW-8 were screened across both zones. The predominant groundwater flow direction is approximately west-southwest across the project site towards Santa Rosa Creek (approximately 160 feet beyond the western side of the property). Therefore, the eastern portion of the project site is considered up gradient relative to the western portion (EBA, 2008b).

2.0 SITE INVESTIGATION

2.1 Scope of Work

As stated in the introduction, Antea Group addressed RWQCB concerns by conducting the following activities:

- **Soil Borings (B1 through B5):** Antea Group advanced five soil borings along the southwest property boundary to evaluate the relationship between on-site and off-site contamination.

- **Qualitative Borings (B6 through B12):** Antea Group advanced seven soil borings utilizing direct push rods equipped with cone penetration testing (CPT) tip and Ultra-Violet Optical Screening Tool (UVOST). Borings were advanced in the vicinity of the UST excavation where in November 2011, United Pumping Services (UPS) removed two 550-gallon tanks and encountered SPH within the excavation. UVOST technology was used to conduct a qualitative field screening of potential hydrocarbon distribution and to optimize sampling locations and potential monitoring well placement.

- **Soil Excavation**: Antea Group excavated soil in the area of soil boring SB-1 to remove hydrocarbon impacted soil observed at 12 feet bgs by EBA during their 2008 investigation.

2.2 Pre-Field Activities

Prior to initiating field activities, Antea Group produced a Health and Safety Plan (HASP) in accordance with Title 8, Section 5192 of the California Code of Regulations. The HASP contained a list of regulatory and emergency contacts, as well as a hospital route map to the nearest emergency facility. Field personnel conducted a daily review for site-specific updates or changes in work conditions. Antea Group obtained all necessary soil boring permits from Sonoma County for soil boring activities. UPS obtained the necessary permits for the excavation from the City of Santa Rosa Fire Department and Planning agencies. In addition, Antea Group and UPS conducted pre-field notifications, as required by the regulatory and permitting agencies. **Appendix C** includes copies of the permits obtained from Sonoma County and the City of Santa Rosa.

2.3 Field Activities

Prior to ground disturbance, Antea Group and UPS contacted Underground Service Alert (USA) North to mark the site for subsurface utilities and employed a private locator to clear each drilling location for subsurface obstructions and hazards. In addition, a California C-57 licensed drilling company cleared each soil boring using a hand auger to a minimum depth of five feet bgs.

2.3.1 Exploratory Soil Borings

On April 23, 2012, Antea Group advanced five soil borings (B1 through B5) on the southwestern boundary of the site utilizing 3.25-inch diameter direct-push rods driven to the terminus of each boring. **Figure 3** illustrates the location of the soil borings. The soil borings were logged continuously using the Unified Soil Classification System (USCS) under the direction of a State Registered Professional Geologist and screened at approximate 2-foot intervals with a photoionization detector (PID). The terminus for each exploratory boring was approximately 20 feet bgs.

Antea Group collected samples from three depth intervals in each boring for laboratory analysis based upon field observations. In each boring a sample was collected from one to five feet bgs, the deepest unsaturated soil interval and any intervals exhibiting the highest PID response or other criteria. The samples were collected from the acetate liner, immediately packed tightly into laboratory provided container and placed in an ice-chilled cooler pending transportation to the laboratory.

Following completion of each of the five soil borings, the driller inserted a pre-packed well screen for the collection of groundwater samples. The pre-packed well screens were five feet in length and consisted of 3/4-inch diameter Schedule 40 polyvinyl chloride (PVC) casing with 0.010-inch slots surrounded by 1.5-inches of 20/40 Grade sand encased in a stainless steel mesh. Antea Group collected grab groundwater samples from each boring utilizing a stainless steel bailer which was decontaminated after each location. The samples were placed in ice pending transportation to the laboratory. Following the collection of groundwater samples, each pre-packed screen was removed and the borehole was sealed with Portland cement grout.

Soil and groundwater samples collected from B1 through B5 were analyzed for the following:

- Diesel range organics (DRO), carbon chain range C10 – C28, and Motor oil range organics (MORO), carbon chain range C24 – C36, by Environmental Protection Agency (EPA) Method 8015B with silica gel cleanup;
- Polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270C SIM

Laboratory analytical reports are included in **Appendix E** and a summary of soil and groundwater analytical data is provided in **Tables 1 and 2**, respectively. Boring logs are included in **Appendix D.** Cross sections showing subsurface soils and current soil and groundwater analytical data are provided as **Figures 6 and 7**.

2.3.2 Qualitative Borings

On April 24 through 25, 2012, Antea Group advanced direct push rods equipped with CPT and UVOST modules (CPT-UVOST) in seven locations (B6 through B12) around the tank pit area recently evaluated by Antea Group. The CPT and UVOST sensors were simultaneously advanced in the same hole. The CPT-UVOST borings were advanced in the locations indicated on **Figure 2.**

During CPT advancement, shallow perched water (Zone A) was detected in borings B8, B10, and B12 at approximately 9 to 12 feet bgs. In these locations, advancement halted at the depth of the shallow water-bearing zone and a grab groundwater sample was collected by evacuating the CPT/UVOST rods from the borehole and advancing standard direct-push rods to the depth of the saturate zone to collect a groundwater sample. Although CPT logs (and pore pressure readings) did not indicate the presence of shallow perched water in B-7, due to the indication of hydrocarbons in boring B-7 illustrated by the UVOST screening profile, Antea Group attempted to collect a shallow groundwater sample from B-7 in the 10- to 14-foot depth interval. Boring B-7 would not yield

water for sample collection in the shallow interval as the perched zone was not present; an attempt to collect a shallow groundwater sample from B-11 was also unsuccessful.

Following the collection of groundwater samples from Zone A, the standard direct-push rods were evacuated from the borehole, and the CPT/UVOST rods were re-advanced in each borehole to complete the soil profile to the total explored depth. The terminus for each test location was approximately 22 to 25 feet bgs.

To avoid cross contamination of shallow and deeper groundwater zones, a second adjacent boring was advanced at each location for the collection of a deeper groundwater sample (Zone B).

Each groundwater sample was collected from a temporary well consisting of ¾-inch diameter Schedule 40 polyvinyl chloride (PVC) casing with 0.010-inch slots was inserted into the direct-push rods. The rods were then raised to expose the screen and allow groundwater to flow into the casing. Samples were collected from the casings utilizing a stainless steel bailer, then decanted into laboratory-provided containers and placed on ice pending transportation to the laboratory.

Following sample collection, each temporary well casing was removed, and the each borehole immediately sealed by tremmying bentonite grout into the boring.

Groundwater samples collected from B6 through B12 were analyzed for the following:

- Diesel range organics (DRO), carbon chain range C10 – C28, and Motor oil range organics (MORO), carbon chain range C24 – C36, by Environmental Protection Agency (EPA) Method 8015B with silica gel cleanup;
- Polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270C SIM

Laboratory analytical reports are included in **Appendix E**; a summary groundwater analytical data is provided in **Table 2.** The CPT and UVOST profiles are included in **Appendix D**. Cross sections showing subsurface soils and current soil and groundwater analytical data are provided as **Figures 6 and 7**.

2.3.3 Soil Excavation

On July 9 through July 13, 2012 UPS and Antea Group conducted soil excavation in the area of former EBA soil boring SB-1. **Figure 5** depicts the extent of the excavation which was 45 feet by 15 feet. The final depth of the excavation was 13 feet bgs, which was the depth to groundwater, as directed by the RWQCB in their October 30, 2009 correspondence.

During the excavation, the breathing zone and surrounding vicinity was monitoring for health and safety purposes using a PID. No significant detections were observed on monitoring devices during excavation activities. Antea Group collected side wall and base samples from the pit. All of the side wall samples were collected roughly 10

feet apart at approximately 6.5 feet bgs with the exception of side wall samples NSW5, NSW6, ESW2, SSW6, and WSW2, which were collected roughly 20 feet apart at approximately 12 feet bgs. The location of sidewall and base samples are illustrated on **Figure 3**. Antea Group submitted the soil samples for the following analysis with the exception of BASE3 and SSW5, which not analyzed due to groundwater saturation:

- DRO and MORO by EPA Method 8015B with Silica Gel Cleanup;
- PAHs by EPA Method 8270C SIM;

For proper waste profiling, three composite soil samples were collected from the excavation area and were submitted for the analytes listed above, plus the following volatile organic compounds (VOCs), semi volatile organic compounds (SVOCs), and metals:

- Gasoline range organics (GRO), benzene, toluene, ethylbenzene and xylenes (BTEX compounds) by EPA Method 8260B;
- Tetrachloroethene (PCE) and trichloroethene (TCE) by EPA Method 8260;
- California Assessment Manual (CAM) 5 metals: cadmium, chromium, nickel, lead, zinc by EPA Method 6010B.

At the request of Sonoma County, Antea Group pumped and containerized groundwater from the excavation. The groundwater recovered from the excavation was temporarily stored on-site, and a composite sample was collected and submitted to a laboratory for the following rush analysis to allow for expedited disposal:

- DRO, and MORO, by EPA Method 8015B with Silica Gel Cleanup;
- GRO and VOCs by EPA Method 8260B;
- SVOCs by EPA Method 8270C;
- PAHs by EPA Method 8270C SIM;
- Total and dissolved CAM 5 Metals: cadmium, chromium, nickel, lead, and zinc, by EPA Method 6010B.

Once the analytical data was received, the groundwater was transported off-site and properly disposed. Composite samples that contained metals (chromium and nickel) detections above initial non-hazardous waste screening requirements were further analyzed for the soluble threshold limit concentration (STLC). STLC regulatory limits were not exceeded. Laboratory analytical reports are provided as **Appendix E** and a summary of soil analytical data is provided in **Table 1**. Waste water analytical is summarized in **Table 2**.

Approximately 758 tons of soil were excavated and properly disposed. Upon completion of soil removal and approval of the City of Santa Rosa Fire Department and RWQCB, the excavation was backfilled with approximately two feet of ballast rock, or 94.36 tons, at the base of the excavation pit. The ballast rock was covered with geofabric, then pea gravel backfilled the excavation and was simultaneously compacted to approximately five feet bgs. Approximately 285 tons of pea gravel was used to backfill the excavation pit, followed by 405 tons of base material, also simultaneously compacted from 5 feet bgs to ground surface. A licensed compaction engineer was onsite to oversee backfilling/compaction activities.

2.3.4 Decontamination and Disposal of Investigation Derived Waste

Soil Borings

Prior to use and between boring locations, down-hole equipment was decontaminated using high-pressure hot water spray. Soil cuttings and wastewater generated during soil boring activities were be placed in Department of Transportation (DOT) approved 55-gallon drums, sealed and labeled in accordance with the corresponding DOT protocols for non-hazardous waste. The drums were sampled for characterization and temporarily stored on-site pending laboratory results, profiling, and the completion of excavation activities. UPS transported the laboratory-profiled waste from the investigation to an appropriate licensed facility at the time of disposal of waste generated during soil excavation activities.

Soil Excavation

UPS pumped approximately 1500 gallons of water from the base of the excavation pit on July 12, 2012. All liquid waste was shipped as non-hazardous liquid to Sea Port at 679 Seaport Blvd in Redwood City. An approximate 757.96 tons of waste soil was generated during excavation activities. Soil was shipped as non-hazardous to Recology Hay Road Facility located in Vacaville, CA on July 10, 2012 and Keller Canyon Sanitary Landfill located in Pittsburg, CA on July 11, 2012.

Appendix F includes the certified laboratory analytical reports of the waste characterization samples; **Appendix G** includes copies of waste manifests.

3.0 ANALYTICAL RESULTS AND DISCUSSION

Conestoga-Rovers and Associates (CRA) performed a data quality assessment and validation for laboratory reports generated for this investigation. CRA concluded that data included in the reports are valid for the intended purpose. Validation forms are included with laboratory analytical reports in **Appendix E**.

3.1 Exploratory Soil Borings

3.1.1 Soil Sampling Analytical Results

The analytical results from soil samples collected on April 23, 2012 are summarized in **Table 1.** Of the soil samples submitted only six samples (B1-5', B1-10', B1-16', B2-11', B4-5', and B4-12') had detections above laboratory reporting limits (LRLs). Of the detection above the LRLs, only two concentrations are above their San Francisco Bay RWQCB environmental screening levels (ESLs). The DRO concentration

in sample B2-11' [240 milligrams per kilogram (mg/kg)] and the concentration of DRO (810 mg/kg) detected in B4-12' exceeded the ESL of 83 mg/kg.

3.1.2 Grab Groundwater Results

The analytical results from groundwater samples collected on April 23, 2012 are summarized in **Table 2.** Detections of MORO, DRO, benzo(b)fluoranthene and pyrene were detected above ESLs in boring B1 and B2. Concentrations of MORO and DRO were detected above ESLs in boring B3 and concentrations of DRO and pyrene were detected above ESLs in boring B4. There were no detections above LRLs in the sample collected from B5. .

3.2 UVOST/CPT Borings

3.2.1 UVOST/CPT Advancement Results

The boring logs and results of the UVOST/CPT advancements are included in **Appendix D.** Analysis of the UVOST data suggests that the only boring displaying minor indications of hydrocarbon impacts is boring B7 at approximately 5 to 10 feet bgs.

3.2.2 Grab Groundwater Results

The analytical results from groundwater samples collected on April 24 through 25, 2012 are summarized in **Table 2.** There were no detections above the LRLs in in the groundwater samples collected from borings B6 though B12.

3.3 Soil Excavation

3.3.1 Soil Analytical Results

The analytical results from the samples collected on July 10 through 11, 2012 are included in **Table 1**. Multiple sidewall and base samples showed detection above the LRLs; however, only four samples had detections above ESLs. In samples SSW1 and SSW2, concentrations of MORO and DRO were above their residential ESL. Sample NSW5 had a detection of benzo(a)pyrene above its residential ESL. DRO in BASE2 and DRO/MORO in SSW1 and SSW2 exceed commercial/industrial ESLs.

4.0 CONCLUSIONS AND RECOMMENDATIONS

Antea Group concludes the following regarding the recent investigation.

- Antea Group recognizes that PCE and TCE have been detected in groundwater beneath the site at various sampling locations; however, the former RWQCB case worker agreed with omitting VOC analysis due to the widespread nature of low-level VOCs & SVOCs, specifically PCE, TCE, and MTBE, which appear to be ubiquitous throughout the area and not related to former onsite activities. This is indicated by elevated VOC detections in up gradient well, MW-8. Additionally, soil samples collected onsite show only trace levels of VOCs, at concentrations that are below ESLs.
- Highest soil concentrations were reported along the southwestern property boundary.

- Groundwater concentrations detected above ESLs were on the southern-most portion of the southwestern property boundary (borings B1 and B2).
- Analysis of the UVOST data surrounding the former UST location suggests that the only boring displaying hydrocarbon impacts is boring B7 at approximately 5 to 10 feet bgs.
- None of the groundwater samples collected from the UVOST/CPT borings contained concentrations above ESLs.
- Based on the results of the UVOST/CPT borings, the 2011 UST removal and excavation appears to have been successful in removing contaminated soil to the extent practicable. In addition, data from the current investigation showed no detections in either water bearing zone around the former tank pit area.
- Significant secondary source soils were successfully removed during excavation activities in the area including and surrounding former EBA boring SB-1, as indicated by visual observation of soils removed as well as waste composite hydrocarbon concentrations.
- The results of the sidewall and base samples of the excavation in the vicinity of EBA boring SB-1 indicate that only samples from the southwest portion of the excavation exceed commercial/industrial ESLs for DRO and MORO.
- The potential exists that impacts along the southwest boundary of the site may be attributed to former operations on the neighboring property (60 West Sixth Street), which has its own history of petroleum product storage tanks and environmental investigations. EBA Engineering's (EBA) Report of Investigation Report dated February 27, 2006 indicates that there were significant groundwater impacts along the property boundary adjacent to the site. Impacts of motor oil concentrations ranged from 130 mg/L - 130,000 mg/L along the property boundary of the adjacent site. In addition, a former underground concrete diesel storage tank was on the adjacent property, near recently advanced boring B3, as well as former underground oil storage tanks just northwest of B-3 and B-2, as depicted on Figure 2 of Kennedy/Jenks Consultant's *Source Area Removal Report, Santa Rosa Station, Santa Rosa, California*, dated January 29, 2004.
- Analytical data from the current investigation and historic data points near and hydraulically upgradient of the property line also suggest that onsite discharges may not be the primary source of impacts along the southwestern property boundary. The highest hydrocarbon impacts appear to reside within the permeable soils that lie at depths between 15 and 20 feet at the property boundary, with relatively low impacts at these depths between former onsite source areas and current significant impacts at the property boundary, suggesting that lateral transport from offsite sources may have occurred preferentially through permeable soil layers rather than from onsite sources in the direction of groundwater flow (**Figure 7**).
- In their August 10, 2012 correspondence, the RWQCB requested submittal of this report and a work plan for the installation of monitoring wells, proposed locations and installation schedule. The *Site*

Assessment Work Plan dated February 29, 2012 included the proposed work scope for monitoring well installation. Antea Group recommends proceeding with the installation of groundwater monitoring wells as proposed in Antea Group's *Site Assessment Work Plan* dated February 29, 2012, but in the locations shown on **Figure 2**. Proposed well locations were selected based upon areas with the highest groundwater impacts along the property boundary, and to monitor the vicinity immediately upgradient of these locations as well as downgradient of the recent UST excavation.

- An extension to the Right of Entry Agreement between UPRR and SMART was obtained on October 3, 2012. This agreement, coupled with the well proposed locations, will allow for prompt well installation.

5.0 SCHEDULE FOR PROPOSED WELL INSTALL AND REPORTING

Antea Group anticipates regulatory comment of the proposed scope of work within 60 days. Antea Group will obtain all necessary permits following RWQCB and SMART approval of the proposed well locations shown on **Figure 2** and the well installation scope as outlined in Antea Group's *Site Assessment Work Plan* dated February 29, 2012. Antea Group will commence field activities within 45 days of receipt approval from the RWQCB.

Upon completion of the fieldwork, Antea Group will prepare a report describing field activities, methods, and analytical results. Antea Group will evaluate the findings of the investigation and include additional recommendations as appropriate.

It is further estimated that the final report will be ready for submittal approximately 45 days after receipt of the sample analytical results.

6.0 REMARKS

The recommendations contained in this document represent Antea USA, Inc.'s professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This document is based upon a specific scope of work requested by the client. For any reports cited that were not generated by Delta or Antea Group, the data from those reports is used "as is" and is assumed to be accurate. Antea Group does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. The contract between Antea USA, Inc. and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this document will be performed. This document is intended only for the use of Antea USA, Inc.'s client and anyone else specifically identified in writing by Antea USA, Inc. as a user of this document. Antea USA, Inc. will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea USA, Inc. makes no express or implied warranty as to the contents of this document.

Notes:
< - Denotes less than the Laboratory Reporting Limit (LRL)
mg/kg - milligrams per kilogram
mg/L - Millilgrams per Liter
bgs - Below Ground Surface
Bold - Reported concentration exceeded the LRL
NA - Not Analyzed
EPA - Environmnetal; Protection Agency
ESL - San Francisco Bay RWQCB Environmental Screening Levels
* - ESL is the same for shallow and deep soils
** - Based on the total concentration detected, a Soluble Threshold Limit Concentration (STLC) analysis was also performed

Analytical Notes
1 - Analyzed by EPA Method 8015B with Silica Gel Cleanup
2 - Analyzed by EPA Method 8270C SIM
3- Analyzed by EPA Method 6010B

Analyte Definitions:
MORO - Motor Oil Range Organics
DRO - Diesel range organics
GRO - Gasoline range organics
VOCs - Volatile Organic Compounds
PAHs - Polycyclic Aromatic Hydrocarbons

Gentlemen:

Subject: Case Status

File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, Case Nos. 1TSR196 and 1NSR196

In the Regional Water Board staff letter dated July 22, 2011, remaining items to be completed were identified, which included the removal of the oil underground storage tank; removal of known shallow soil impacts; and removal of impacted soil in the vicinity of SB-1. It was stated that if evidence of a discharge is revealed at the time of tank removal, contaminated soil must be removed and depending upon the degree of discharge, the impact to water quality may need to be investigated. The purpose of this letter is to bring this file up to date summarizing work conducted since July 2011 and reiterating work items that remain to be completed.

Underground Storage Tanks

On November 3, 2011, the underground oil storage tank was removed. At the time of removal, a second tank was discovered and removed along with visually impacted soil. The excavation was continued to groundwater where separate phase oil product was observed.

Based on recent communications with Antea Group staff working on behalf of Union Pacific Railroad, report preparation is in progress and submittal is anticipated in the next few weeks.

Shallow Soil Impacts

As previously stated, shallow soil impacts may be addressed prior to and/or during property development.

Soil Removal at SB-1

Soil removal in the area of SB-1 must be completed as soon as possible and prior to land development activities. The work may be conducted according to the existing work plan prepared by EBA Engineering submitted on behalf of the Railroad Square Associates, LLC (who is not a responsible party) or a new work plan. If someone other than EBA Engineering implements the existing work plan, the licensed professional in responsible charge of the project must be identified.

Based on the current development plans, a delay in completing remedial actions in the area of SB-1 may impact the installation of proposed infrastructure.

Extent of Groundwater Impacts

In addition to the soil removal project at SB-1, a work plan must be submitted to investigate the extent of groundwater impacts including the presence of separate phase oil at the former tank location, groundwater impacts in the area of SB-1, and clarify the relationship of on-site discharges and off-site impacts to the west beneath adjacent properties. The work plan is due within 45-days of issuance of this letter.

If you have any questions or would like to meet to discuss this case, I can be reached at (707) 576-2675 and Jfleck@waterboards.ca.gov.

Sincerely,

Joan Fleck
Engineering Geologist

Gentlemen:

Subject: UST Removal Report and Site Assessment Work Plan

File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, Case Nos. 1TSR196 and 1NSR196

Regional Water Board staff (staff) reviewed the January 24, 2012 *UST Removal Report* and the February 29, 2012 *Site Assessment Work Plan* prepared by Antea™Group for the former rail yard in Santa Rosa. Staff has no comments on the *UST Removal Report*. The *Site Assessment Work Plan* was discussed with Antea™Group staff on March 15, 2012. The discussions included:

- The excavation of impacted soil in the vicinity of SB-1 (as proposed in the EBA Engineering *Soil Excavation Work Plan* dated October 2009) is acceptable. The excavation depth is to groundwater and groundwater/separate phase hydrocarbon removal from the open excavation is planned.
- The drilling of qualitative borings using the CPT-UVOST technology is acceptable. However, the extent of dissolved phase hydrocarbons must also be defined. Staff request that grab groundwater samples also be collected for chemical analysis.
- The drilling of the exploratory soil borings on the southwestern boundary is acceptable.

By copy of this letter, Santa Rosa Fire and Sonoma County Environmental Health have been informed of our concurrence to enable the processing of the excavation and drilling permits, respectively. Due to competing interests at this property and the need to coordinate efforts, an expedited work plan implementation schedule is highly encouraged.

If you have any questions, I can be reached at (707) 576-2675 and Jfleck@waterboards.ca.gov.

Sincerely,

Appendix B

Site Details and Summary of Previous Environmental Investigations

PREVIOUS INVESTIGATION AND SITE HISTORY SUMMARY

Over the history of environmental activities at the site, laboratories and consultants have used a wide variety of terms for petroleum hydrocarbons reported in analysis of soil and water. Soil and groundwater samples are analyzed typically by Environmental Protection Agency (EPA) method 8015B or 8260B. Antea Group uses the designation GRO for total petroleum hydrocarbons as gasoline within the C_5 to C_{10} carbon range, DRO for total petroleum hydrocarbons as diesel within the C_{10} to C_{28} carbon range, and RRO for total petroleum hydrocarbons as residual range organics (oil) within the C_{24} to C_{40} carbon range.

Terms from previous reports may include total recoverable petroleum hydrocarbons (TRPH), total purgeable petroleum hydrocarbons (TPPH) for GRO, total extractable petroleum hydrocarbons (TEPH) for DRO, and total volatile hydrocarbon (TVH) which refers to a broad carbon range. More specific historical terms are total petroleum hydrocarbons as gasoline (TPHg or TPH-G), total petroleum hydrocarbons as diesel (TPHd or TPH-D), and total petroleum hydrocarbons as oil or motor oil (TPHo, TPHmo, TPH-O, or TPH-MO). The designations are generally comparable to GRO, DRO, and RRO. Antea Group has left the original designation when summarizing historic data and the current designations when applied to recent investigations and summary discussions.

SITE HISTORY

In December 1987, Canonie Environmental Services Corporation (Canonie) removed three USTs from the site. These included a 230-gallon fuel oil UST, a 10,000-gallon diesel UST, and a 10,000-gallon gasoline UST, which were located within and northwest of the existing fenced enclosure. During UST removal activities, no holes or signs of leakage or overfilling were noted for any of the tanks. TPH were not detected above laboratory reporting limits in the soil samples collected from beneath the USTs (Industrial Compliance [IC], 1992).

In April 1990, the North Coast Regional Water Quality Control Board (RWQCB) drilled four borings in the western portion of the property and installed monitoring wells in two of the borings (MW-2 and MW-3). Monitoring well MW-3 was located approximately 100 feet down gradient (to the southwest) of the former fuel oil UST. Based on information presented in a July 1992 report by IC, analytical results for samples collected from the RWQCB borings showed that no petroleum hydrocarbons were present in soil samples collected from soil boring B-1. However, oil and grease was present in the soil sample collected from boring B-1 at 12 feet bgs at a concentration of 200 milligrams per kilogram (mg/kg). Additionally, this sample contained low concentrations of polynuclear aromatic hydrocarbons (PAHs). Soil samples collected at depths of 6 and 16 feet below ground surface (bgs) from soil boring MW-3 contained petroleum hydrocarbons quantified as diesel (TPHd) at concentrations of 11 and 30 mg/kg, respectively. No petroleum hydrocarbons were detected in the groundwater sample collected by the RWQCB from monitoring well MW-2; TPHd was detected at a concentration of 0.4 milligrams per liter (mg/l) in the groundwater sample collected at monitoring well MW-3 (Geomatrix Consultants, Inc. [Geomatrix], 2000).

Soil and grab groundwater samples were collected from five borings located near the former UST area by IC in 1992. No detectable concentrations of petroleum hydrocarbons, benzene, toluene, ethylbenzene, or xylenes

(BTEX compounds), or PAHs were reported in any of the soil samples collected. Grab groundwater samples collected from the location of the former diesel and gasoline USTs did not contain petroleum hydrocarbons or BTEX above laboratory reporting limits. The grab groundwater sample collected from the former fuel oil tank location reportedly contained TPHd at concentrations of 31 mg/l; no gasoline or BTEX compounds were detected in the grab groundwater sample collected from IC-B6 (Geomatrix, 2000).

The RWQCB destroyed monitoring wells MW-2 and MW-3 in June 1995. In November 1996, Geomatrix performed an investigation of soil and groundwater at the site to evaluate potential significant environmental impacts resulting from historical features or features identified during previous investigations and to respond to a request by the RWQCB to perform additional characterization in the vicinity of the former underground fuel oil tank. Twelve borings (SRB20 through SRB31) were drilled and samples were analyzed for TPHd, total petroleum hydrocarbons quantified as motor oil (TPHmo), PAHs, metals, and volatile organic compounds (VOCs). Soil samples collected for analyses of TPHd, PAHs, and metals were composited vertically from each boring; discrete samples subsequently were analyzed if elevated concentrations of constituents were detected. Only discrete samples were analyzed for VOCs. Petroleum hydrocarbons were detected in soil at elevated concentrations in boring SRB20 and SRB21, however the presence of petroleum hydrocarbons at these locations decreased with depth. Specifically, the shallower composite sample from SRB20 contained TPHmo at a concentration of 900 mg/kg. Discrete samples from depths of 4.0 and 6.5 feet contained TPHmo at concentrations of 69 mg/kg and less than 5 mg/kg, respectively. No TPHd was detected in soil samples from boring SRB20. In SRB21, TPHmo was present at a concentration of 510 mg/kg in the shallow composite sample; no TPHmo was detected in deeper, discrete samples from this boring. Shallow composite and deeper discrete soil samples from boring SRB21 contained TPHd, at a maximum concentration of 1,600 mg/kg. The concentration of TPHd in this boring decreased with depth and was not detected in the sample collected from 13.5 feet bgs (Geomatrix, 2000).

PAHs were detected in soil at concentrations below 1996 EPA screening criteria for industrial exposure. Concentrations of PAHs detected at this time are also below current PRGs (USEPA, 1999). For example, the maximum detected concentration of benzo(a)pyrene was 0.026 mg/kg in the discrete sample collected from a depth of 12.5 feet bgs in boring SRB22; the current PRG for benzo(a)pyrene is 0.29 mg/kg. The highest PAH concentration detected was in the discrete soil sample collected from a depth of 7 feet bgs in boring SRB22. In this sample, flourene was detected at a concentration of 0.87 mg/kg; the PRG for flourene is 33,000 mg/kg. Metals concentrations in soil were within expected background concentrations and less than 10 times the soluble threshold limit concentration (STLC)4 in all of the soil samples (discrete and composite). Concentrations of metals in soil samples also were below industrial PRGs. No TPHd, TPHmo, or VOCs were detected in groundwater above laboratory reporting limits. The results of the 1996 sampling program indicated no significant environmental issues at the site. However, based on its review of the results of the November 1996 work, the RWQCB requested that additional issues be addressed before case closure would be considered. These items, which are the focus of the work described herein, include additional evaluation of historical features, potential leachability of petroleum hydrocarbons, and groundwater quality at various site locations (Geomatrix, 2000).

In September 2001, five on-site and off-site groundwater monitoring wells were installed to characterize impacts to groundwater at the project site. A majority of wells were installed in the area of the aforementioned Santa Rosa Woolen Mills facility in the northwest portion of the project site. An up-gradient, single-screen monitoring well was installed on the eastern portion of the property in vicinity of the main line railroad tracks.

Extensive investigative activities were performed in 2002 on the northwest area of the project site at the historical location of the Santa Rosa Woolen Mills Facility. Soil samples collected as part of an investigation within this area reported significant concentrations of petroleum hydrocarbons present in soil and groundwater in the area of the fueling structures, the area of the former above ground fuel storage tank (AST), and the location of a former UST. Impacts to soil were identified as being primarily heavy range petroleum hydrocarbons. From June 2002 to November 2002, an additional characterization was performed in the northwestern area and a fenced enclosure at the property. Soil samples collected from these areas indicated significant concentrations of diesel and motor oil in soil. Proposed remedial options included excavation and removal of accessible impacted soil (EBA, 2008b).

In October and November 2003, approximately 6,500 cubic yards of impacted soil were removed from several areas of the project site. The most significant remediation efforts targeted the northwestern portion of the project site where several areas were excavated to remove impacted soil. Source removal activities began in the area of a former wooden UST that is indicated on historic Sanborn maps for the Santa Rosa Woolen Mills facility. During the excavation activities, remnants of the former UST were found and removed, whereupon the excavation was advanced to a total depth of approximately 18 feet bgs. A significant amount of free-phase petroleum hydrocarbon product was encountered on the groundwater surface during the excavation activities. The product and water was subsequently pumped, treated, and disposed of to the sanitary sewer. The excavation in this area, which resulted in the removal of approximately 700 cubic yards of impacted materials, proceeded to within 20 feet of the existing Sixth Street Warehouse and was subsequently terminated due to concerns of structure stability. Confirmation soil samples indicated that impacted materials containing significant concentrations of diesel and motor oil remained in place in the excavation sidewalls and groundwater in this area (EBA, 2008b).

Excavation activities in the northwestern portion of the property also included the removal off a fuel pipeline. The associated trench was enlarged as it encountered impacted materials in an area designated as the main pit excavation area. A total of 350 cubic yards of impacted materials were removed from this area. The excavation pit extended to depths below first encountered groundwater, which was encountered at approximately 19 feet bgs. The maximum depth attained by the excavation was approximately 22 feet bgs. Impacted groundwater encountered within the excavation pit, which included free-phase petroleum hydrocarbon product, was subsequently removed using pumps, treated, and disposed of to the sanitary sewer (EBA, 2008b).

Additional excavation was also performed on the south side of the aforementioned product line trench in the northwestern area. Approximately 325 cubic yards of impacted soil was removed from this area. Approximately 270 cubic yards of impacted soil was excavated and removed in the southwestern side of the project site identified as the “southern warehouse area” (EBA, 2008b).

Quarterly groundwater monitoring performed in the northwestern portion of the project site property and west into the neighboring property parcel indicated low levels of petroleum hydrocarbons in a monitoring well identified as SRMW-13 located in the northwest corner of the property. In addition, the fuel oxygenate methyl tert-butyl ether (MTBE) was detected in SRMW-8 located on the northeast side of the property. The remaining monitoring wells appear to have been relatively free of impacts during the time monitored (EBA, 2008b).

The RWQCB issued a *No Further Action* (NFA) letter for the previous case at the site on August 31, 2007. In 2008, Sonoma Marin Area Rail Transit District (SMART) granted an option to purchase the site, formerly owned by Northwestern Pacific Railroad Authority (NWRPA) to New Railroad Square Associates, LLC for transit-oriented development purposes. In anticipation of property ownership for the site, New Railroad Square Associates, LLC (with consent from SMART) contracted the services of EBA Engineering (EBA) to perform environmental assessment activities. EBA's November 2008 *Comprehensive Report on Findings* concluded that on-site hazardous materials presently exist at various locations on the property. These materials include an underground oil storage tank (UST), heavy hydrocarbon soil and groundwater impacts in the vicinity of soil boring SB-1, and impacted shallow soil across the site. The RWQCB reopened the environmental case for the site on January 16, 2009 based on EBA's findings.

In a letter dated February 4, 2011, the RWQCB directed UPRR to remove the oil UST on the property. In November 2011, United Pumping Services (UPS) removed the UST as directed. However, during the initial day-lighting activities of the oil UST, an additional 500-gallon UST containing oil was discovered adjacent and west of the known tank. UPS evacuated, cleaned, and removed the second UST in conjunction with the known UST. UPS excavated and disposed of approximately 213.03 tons of impacted soil surrounding the USTs, and pumped approximately 500 gallons of oil impacted groundwater from the excavation. Antea Group collected 16 soil samples and one grab groundwater sample from within the excavation. Based on the distribution of MORO, DRO, VOCs, and PAHs, it appears that a release from the removed USTs only affected the immediate soils surrounding the USTs. Sidewall samples NWB and SWB collected at 15 feet bgs reported concentrations of VOCs and PAHs not found in any other (shallower) samples collected. From the available data, soil VOCs and PAHs impacts appear to be the result of impacted groundwater within the capillary fringe, originating from outside of the excavated area, and not due to a release from the USTs at that location.

SENSISTIVE RECEPTORS

Geomatrix performed a well survey in 2000. Domestic and industrial water supply for the site vicinity is provided through the City of Santa Rosa, which purchases water from the Sonoma County Water Agency (SCWA). The SCWA delivers water to the City via the Sonoma County aqueduct. The source of the water is the Russian River, which is fed by three main upstream reservoirs. The City of Santa Rosa also has eight standby wells to pump groundwater for emergency purposes; these wells currently are not in use (Geomatrix, 2003).

Information provided by the City of Santa Rosa Utilities Department (SRUD) indicates that 50 groundwater wells are located within a half mile of the site. Of these wells, 21 are located within a half mile generally to the north (hydraulically up- and cross-gradient of the site) and 29 are located within a half mile generally to the south (hydraulically down-gradient of the site). Of the 50 wells, only four are located within a one-quarter mile radius, with two wells located approximately up gradient and two approximately down gradient. Based on conversations with SRUD personnel, only two of the residences located within one-half mile from the site are not connected to the City of Santa Rosa water supply. These residences are located at 654 and 658 Dutton Avenue. Uses for the wells are not tracked by SRUD in all cases, but records indicate that the wells within one-quarter mile of the site are used for irrigation and external use (Geomatrix, 2003).

Information about the possible presence of an additional water producing well located near the site was provided by the RWQCB. This well was not included in the SRUD database. The well is located to the west of the site between the site and Santa Rosa Creek; its actual location has not been field-verified. At this time the well is not in use, and based on a conversation with the site redeveloper, the well will not be used in the future and will be appropriately destroyed (Geomatrix, 2003).

SANTA ROSA FIRE DEPT.

Yvette Pico
Antea Group
312 Piercy Road
San Jose, CA 94086

Ms. Pico,

Our Department has reviewed the Site Assessment Work Plan (Dated February 29, 2012) for the SMART project located at 2 Fourth Street and 34 Sixth Street. Our Department concurs with the work plan. However, we will need you to initiate our submittal for the soil remediation process so we can assist you in moving forward with this project.

Please contact Judy Tapparo at (707) 543-4547. Mrs. Tapparo can assist you in completing your permit application and plan review applications. During this process, we will be able to quickly review additional required information such as your site safety plan, licenses, permits, subcontractor information and sampling details.

Thank you in advance and please don't hesitate to contact me at (707)543-3531 if you have any questions.

Respectfully,

Tony Gossner
Deputy Fire Chief

PERMIT

Santa Rosa Fire Department
2373 Circadian Way
Santa Rosa, CA 95407

Date: 04/24/2012

Permit For:
SOIL REMOVAL - 2 4TH ST & SIXTH ST - UNION PACIFIC RAILROAD

U.F.C. Section(s): 1844.105.8.h.1

Permittee: UNITED PUMPING SERVICE INC

PERMIT INFORMATION

Address:	2 4th St SR	Permit No:	F12-0170
Total Fees:	$630.00	Approved Date:	04/24/2012
Date Issued:	04/24/2012	Date Expires:	10/21/2012

A permit shall not take the place of any license required by law.

A permit issued under the Fire Code shall continue until revoked or for such a period of time as designated therein at the time of issuance. A permit shall not be transferable and any change in use, occupancy, operation or ownership shall require a new permit.

By: Marita Petersen/fat
Santa Rosa Fire Department

THIS PERMIT MUST AT ALL TIMES BE KEPT POSTED ON THE PREMISES.

Required Inspections:
Item: 00854 SOIL REMEDIATION
Item: 00868 OTHER HAZMAT

THE PLANS YOU SUBMITTED HAVE BEEN:

☐ APPROVED subject to inspection and compliance with the attached Plan Review notes and drawings. Approval of construction documents shall not be construed to be a permit for, or an approval of, any violation of any provisions of the California Building Code or other ordinances of the jurisdiction. Permits presuming to give authority to violate or cancel the provisions of the California Building Code or other ordinances of the jurisdiction shall not be valid.

Date: [redacted]

Approved by:

☐ NOT APPROVED. Plans do not conform to the California Building Code and other ordinances of the jurisdiction. Changes and additions to the plans shall be required and resubmitted for review prior to the issuance of a permit. See the attached plan review notes.

Date:

Approved by:

Plans complete with corrected plans shall be re-submitted along with a copy of the Permit Application & Plan Review sheet. Failure to make the required corrections will result in the plans being withdrawn from the review process. Plans will be held for 90 days from the date of the last correspondence from this office. After 90 days, plans will be destroyed unless a written request is received to keep them longer.

The approved plans and Plan Review Form shall be on site and available for review during inspections. Please schedule inspections with the Area Inspector a minimum of [redacted] hours in advance.

Re-inspection approvals must be given prior to use of occupancy of the permitted portion of project.

Please complete if applicable:

Fire sprinkler plans & calculations under separate permit.

Fire alarm plans & cut sheets under separate permit.

Underground or aboveground tanks under separate permit.

I certify that I have read the application and state that the information contained within is correct. I agree to comply with all city and county ordinances and state laws relating to building construction. I hereby authorize representatives of this jurisdiction to enter upon the above-mentioned property for inspection purposes. I understand that a separate permit is required for electrical, plumbing, mechanical, and fire sprinkler work.

RE: **Data Quality Assessment and Validation of Reports J43205, J43207, J43229, J43231, J43270 & J43300**
Site Assessment
2 Fourth Street and 34 Sixth Street
Santa Rosa, California
July 2012

INTRODUCTION

The following details a quality assessment and validation of the analytical data resulting from the July 2012, collection of soil and water samples in Santa Rosa, California. Samples were submitted to Test America Laboratories (TA), in Pleasanton, California, and analyzed for the following:

Parameter	*Methodology*
Volatile Organic Compounds (VOCs)	SW846 8260B
Gasoline Range Organics (GRO)	CA LUFT GC/MS
Semi-Volatile Organic Compounds (SVOCs)	SW846 8270C SIM
Diesel Range Organics (DRO)/Motor Oil Range Organics (ORO)	SW846 8015B
Metals	SW846 6010B

The analytical results are summarized in Tables 1A and 1B. The QC criteria used to assess the data were established by the methods and with the following guidance documents:

i) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", USEPA 540/R-99/008, October 1999

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Review", USEPA 540/R-94/013, February 1994

These guidelines are collectively referred to as "Guidelines" in this memorandum.

SAMPLE QUANTITATION

The laboratory did not report any detected concentrations below the laboratory's practical quantitation limit (PQL)/report limit (RL).

SAMPLE PRESERVATION AND HOLDING TIMES

Sample holding time periods and preservation requirements are summarized in the analytical methods. All sample extractions and/or analyses were performed within the specified holding times.

All samples were properly preserved and cooled after collection.

METHOD BLANK SAMPLES

Method blank samples are prepared from a purified sample matrix and are processed concurrently with investigative samples to assess the presence and the magnitude of sample contamination introduced during sample analysis. Method blank samples are analyzed at a minimum frequency of one per analytical batch and target analytes should be non-detect.

Method blanks were analyzed at the recommended frequency and all results were non-detect for the compounds of interest.

SURROGATE COMPOUNDS – ORGANIC ANALYSES

Individual sample performance for organic analyses was monitored by assessing the results of surrogate compound percent recoveries. Surrogate percent recoveries are reviewed against the laboratory developed control limits provided in the analytical report.

All surrogate recoveries met the method criteria, demonstrating acceptable analytical efficiency for these analyses with a few exceptions. Several sample results were qualified as estimated (See Table 2).

LABORATORY CONTROL SAMPLE (LCS)

The LCS analysis serves as a monitor of the overall performance in all steps of the sample analysis and are analyzed with each sample batch. The LCS percent recoveries were evaluated against method and laboratory established control limits.

Laboratory control samples (LCS) were analyzed in duplicate for all parameters. All recoveries were within required control limits showing adequate analytical accuracy and precision.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) ANALYSES

To assess the long term accuracy and precision of the analytical methods on various matrices, MS/MSD percent recoveries and relative percent differences (RPD) of the concentrations were determined. The organic MS/MSD percent recovery and RPD control limits are established by the laboratory. The inorganic control limits are defined by the methods and the "Guidelines", which require recoveries between 75 to 125 percent with RPDs less than 20 percent for water samples and 30 percent for soil samples.

Matrix spikes (MS) were prepared and analyzed in duplicate for DRO/ORO and metals. All recoveries were within required control limits showing adequate analytical accuracy and precision. Precision, for VOCs, GRO and SVOCs, was determined to be acceptable based on LCS/LCSD recoveries.

FIELD QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

No field QA/QC samples were submitted to the laboratory for analysis.

OVERALL ASSESSMENT

The data were found to exhibit acceptable levels of accuracy and precision, based on the provided information, and may be used with the qualifications noted.

RE: Data Quality Assessment and Validation of Reports J41839 & J41840
Site Assessment
2 Fourth Street and 34 Sixth Street
Santa Rosa, California
April 2012

INTRODUCTION

The following details a quality assessment and validation of the analytical data resulting from the April 2012, collection of soil and groundwater samples in Santa Rosa, California. Samples were submitted to Test America Laboratories (TA), in Pleasanton, California, and analyzed for the following:

Parameter	*Methodology*
Volatile Organic Compounds (VOCs)	SW846 8260B
Semi-Volatile Organic Compounds (SVOCs)	SW846 8270C
Gasoline Range Organics (GRO)	CA LUFT GC/MS
Diesel Range Organics (DRO)/Motor Oil Range Organics (ORO)	SW846 8015B
Metals	SW846 6010B

The analytical results are summarized in Tables 1A and 1B. The QC criteria used to assess the data were established by the methods and with the following guidance documents:

i) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", USEPA 540/R-99/008, October 1999

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Review", USEPA 540/R-94/013, February 1994

These guidelines are collectively referred to as "Guidelines" in this memorandum.

SAMPLE QUANTITATION

The laboratory did not report any detected concentrations below the laboratory's practical quantitation limit (PQL)/report limit (RL).

SAMPLE PRESERVATION AND HOLDING TIMES

Sample holding time periods and preservation requirements are summarized in the analytical methods. All sample extractions and/or analyses were performed within the specified holding times.

All samples were properly preserved and cooled after collection.

METHOD BLANK SAMPLES

Method blank samples are prepared from a purified sample matrix and are processed concurrently with investigative samples to assess the presence and the magnitude of sample contamination introduced during sample analysis. Method blank samples are analyzed at a minimum frequency of one per analytical batch and target analytes should be non-detect.

Method blanks were analyzed at the recommended frequency and all results were non-detect for the compounds of interest.

SURROGATE COMPOUNDS – ORGANIC ANALYSES

Individual sample performance for organic analyses was monitored by assessing the results of surrogate compound percent recoveries. Surrogate percent recoveries are reviewed against the laboratory developed control limits provided in the analytical report.

All surrogate recoveries met the method criteria, demonstrating acceptable analytical efficiency for these analyses with a few exceptions. Two sample results were qualified as estimated (See Table 2).

LABORATORY CONTROL SAMPLE (LCS)

The LCS analysis serves as a monitor of the overall performance in all steps of the sample analysis and are analyzed with each sample batch. The LCS percent recoveries were evaluated against method and laboratory established control limits.

Laboratory control samples (LCS) were analyzed in duplicate for all parameters. All recoveries were within required control limits showing adequate analytical accuracy and precision.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) ANALYSES

To assess the long term accuracy and precision of the analytical methods on various matrices, MS/MSD percent recoveries and relative percent differences (RPD) of the concentrations were determined. The organic MS/MSD percent recovery and RPD control limits are established by the laboratory. The inorganic control limits are defined by the methods and the "Guidelines", which require recoveries between 75 to 125 percent with RPDs less than 20 percent for water samples and 30 percent for soil samples.

Matrix spikes (MS) were prepared and analyzed in duplicate for SVOCs, DRO/ORO and metals. All recoveries were within required control limits showing adequate analytical accuracy and precision with a few exceptions. One sample result was qualified as estimated (See Table 3). Precision, for VOCs and GRO, was determined to be acceptable based on LCS/LCSD recoveries.

FIELD QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

No field QA/QC samples were submitted to the laboratory for analysis.

OVERALL ASSESSMENT

The data were found to exhibit acceptable levels of accuracy and precision, based on the provided information, and may be used with the qualifications noted.

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits

GC Semi VOA

Qualifier	Qualifier Description
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

Job Narrative
720-41840-1

Comments
The report is revised to change units to mg/Kg.

Receipt
The samples were received on 4/26/2012 6:20 PM; the samples arrived in good conditions, properly preserved and on ice. The temperatures of the 7 coolers at receipt time were 0.60 C, 1.40 C, 1.60 C, 2.20 C, 2.90 C, 3.10 C and 3.90 C.

Except:

No project name on the COC. Sample times not specified with AM or PM, logged all samples collected after 12:00 as PM.
Received one of four amber 1L's for W-2344-B4-042312 @ 4:45 half full.

The container label for the following sample(s) did not match the information listed on the Chain-of-Custody (COC): #17. The container labels list W-2344-B3-042312 @ 4:00. The COC lists W-2344-B2-042312 @ 4:00. Logged using sample ID because there is a B2 @ 3:45 water #16.
Received (#22) 2 of 4 1L's for B6B @ 11:45 water were labeled B6, logged by COC all 4 1L's as B6B.
Received (#23) 3 of 4 1L's for B7B @ 1:21 water were labeled B7, logged by COC all 4 1L's as B7B.

GC/MS Semi VOA
Method 8270C SIM: The following sample was diluted due to the abundance of non-target analytes: W-2344-B1-042312 (720-41840-15), W-2344-B2-042312 (720-41840-16). Elevated reporting limits (RLs) are provided.

Method 8270C SIM: Surrogate recovery for the following sample was outside control limits: W-2344-B1-042312 (720-41840-15), W-2344-B2-042312 (720-41840-16). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

Method 8270C SIM: The following sample was diluted due to the abundance of non-target analytes: SO-2344-B4-12'-042312 (720-41840-13). Elevated reporting limits (RLs) are provided.

Method 8270C SIM: The following sample was diluted due to the abundance of non-target analytes: SO-2344-B1-10'-042312 (720-41840-5), SO-2344-B1-5'-042312 (720-41840-1), SO-2344-B2-11'-042312 (720-41840-7), SO-2344-B4-5'-042312 (720-41840-9), SO-2344-COMPOSITE-042512 (720-41839-1). Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

GC Semi VOA
Method 8015B: The continuing calibration verification (CCV) associated with batch 112671 recovered above the upper control limit for MO c24-c36. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: W-2344-B12B-042512 (720-41840-30), W-2344-B8A-042512 (720-41840-31).

Method 8015B: Due to the level of dilution required for the following sample, surrogate recoveries are not reported: W-2344-B2-042312 (720-41840-16), W-2344-B4-042312 (720-41840-20).

Method 8015B: Due to the level of dilution required for the following sample, surrogate recoveries are not reported: SO-2344-B2-11'-042312 (720-41840-7), SO-2344-B4-12'-042312 (720-41840-13).

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Creator: Bullock, Tracy

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	False	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	False	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Definitions/Glossary

Client: Antea USA, Inc.
Project/Site: UPRR- Santa Rosa

TestAmerica Job ID: 720-43207-1

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 7/11/2012 7:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice.
The temperature of the cooler at receipt was 4.1º C.

Except:

Received 2 containers not listed on coc: SO-2344-SSW-100712 and SO-2344-SSW1-100712 the time on both containers is 9:30.
Logged as 1 sample with 2 containers on hold.

GC/MS Semi VOA
Method 8270C SIM: The following sample was diluted due to the abundance of non-target analytes: SO-2344-SSW1-100712 (720-43207-3), SO-2344-SSW2-100712 (720-43207-4). Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

GC Semi VOA
Method 8015B: Due to the level of dilution required for the following sample, surrogate recoveries are not reported: SO-2344-SSW1-100712 (720-43207-3), SO-2344-SSW2-100712 (720-43207-4).

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Note: By relinquishing samples to Test America, client agrees to pay for the services requested on this chain of custody form and any additional analyses performed on this project. Payment for services is due within 30 days from the date of invoice. Sample(s) will be disposed of aftar 30 days.

Login Sample Receipt Checklist

Client: Antea USA, Inc.

Job Number: 720-43207-1

Login Number: 43207
List Number: 1
Creator: Mullen, Joan

List Source: TestAmerica Pleasanton

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 7/12/2012 6:40 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.5º C.

GC/MS Semi VOA
Method 8270C SIM: The following sample was diluted due to the abundance of non-target analytes: SO-2344-SSW3-110712 (720-43231-2). Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

GC Semi VOA
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 7/13/2012 5:55 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.1º C.

GC/MS Semi VOA
Method 8270C SIM: The following sample was diluted due to the abundance of non-target analytes: SO-2344-NSW5-110712 (720-43300-3), SO-2344-WSW2-110712 (720-43300-2). Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

GC Semi VOA
Method 8015B: Capric acid surrogate recovery for the following sample(s) was outside control limits: SO-2344-WSW2-110712 (720-43300-2). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

List Number: 1

Creator: Bullock, Tracy

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 7/13/2012 7:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.4º C.

Except:

Received 4 trip blank vials not listed on coc. Logged on hold.

GC/MS VOA
No analytical or quality issues were noted.

GC/MS Semi VOA
No analytical or quality issues were noted.

GC Semi VOA
No analytical or quality issues were noted.

Metals
Method 6010B: The continuing calibration verification (CCV) associated with analysis batch 117168 recovered above the upper control limit for Cr. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The following samples are impacted: 720-43270-k-1

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Creator: Mullen, Joan

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Definitions/Glossary

Client: Antea USA, Inc.
Project/Site: UPRR- Santa Rosa

TestAmerica Job ID: 720-43205-1

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 7/11/2012 7:20 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 4.6º C.

GC/MS VOA
No analytical or quality issues were noted.

GC/MS Semi VOA
Method 8270C SIM: The following sample was diluted due to the abundance of non-target analytes: SO-2344-COMP1-100712 (720-43205-1), SO-2344-COMP2-100712 (720-43205-2). Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

GC Semi VOA
Method 8015B: Due to the level of dilution required for the following sample, surrogate recoveries are not reported: SO-2344-COMP2-100712 (720-43205-2).

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The sample was received on 7/11/2012 6:40 PM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.5º C.

GC/MS VOA
No analytical or quality issues were noted.

GC/MS Semi VOA
Method 8270C SIM: The following sample was diluted due to the abundance of non-target analytes: SO-2344-COMP3-110712 (720-43229-1). Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

GC Semi VOA
Method 8015B: Surrogate recovery for the following sample was outside control limits: SO-2344-COMP3-110712 (720-43229-1), (720-43229-1 MS), (720-43229-1 MSD). Evidence of matrix interference is present; therefore, re-extraction and/or re-analysis was not performed.

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Detection Summary

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

UST Removal Report

Union Pacific Railroad
2 Fourth Street and 34 Sixth Street, Santa Rosa, California
North Coast Regional Water Quality Control Board Case No. 1TSR196

1.0 INTRODUCTION

Antea™Group has prepared this *UST Removal Report* for the North Coast Regional Water Quality Control Board (RWQCB) in response to their February 4 and July 22, 2011 agency letters (**Appendix A**). The purpose of this report is to summarize UST removal and excavation field activities conducted at the site.

1.1 Site Description

Currently, the site is vacant with no operations. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the 3 West Third Street and 60 West Sixth Street Warehouses, to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties (**Figure 1**).

1.2 Site History

This site has remained vacant and generally unused since the late 1960's. Consultants have conducted environmental investigation and remediation efforts at the site since 1987. Former operations at the site included the use of aboveground storage tanks (ASTs) and underground storage tanks (USTs), the main line track system that occupied the eastern side of the property, several associated railroad spurs and siding, a turntable, warehouses, and freight houses. A Sanborn Fire Insurance map dated 1885 indicates the Santa Rosa Woolen Mills was located in the northwestern portion of the site until approximately 1906 (EBA, 2009a). **Appendix B** includes a history of environmental investigations and remedial activities conducted at the site. **Figure 2** shows the locations of historic borings and wells at the site.

1.3 Geologic and Hydrogeologic Setting

1.3.1 Regional Geology

The site is centrally located within the Santa Rosa Plain, which is part of the Coast Range Geomorphic Province of northern California. The Coast Range Geomorphic Province is characterized as a series of northwest trending elongated ridges and valleys that are a result of folding and faulting. The Santa Rosa Plain consists of alluvial fan deposits of Pleistocene and Holocene age. The alluvial fan deposits form a nearly continuous blanket over the Santa Rosa Plain and consist of poorly sorted coarse sand and gravel, moderately sorted fine sand and silt, and silty clay. The region has been mapped as having basement materials that underlie the alluvial fan deposits. The

basement materials consist of marine sedimentary rocks of the Miocene Age Wilson Grove Formation. Portions of the Wilson Grove Formation are overlain by younger continental sedimentary rocks of the Pliocene-Pleistocene Age Glen Ellen Formation (EBA, 2008b).

1.3.2 Site Geology and Hydrogeology

The geology of the project site is characterized by shallow rocky fill in the upper one to two feet below ground surface (bgs) that is underlain by sandy silt and clayey sediments containing varying amounts of angular to sub-rounded gravel. These finer-grained sediments extend to approximately 20 feet bgs, and are underlain by a laterally continuous sandy coarse-grained unit extending to at least 25 feet bgs, the maximum depth explored at the project site to date (EBA, 2008b).

The hydrogeology of the project site is likely controlled by gradational lenses of sediments separated by clayey layers. A thin laterally extensive sandy unit overlays a similarly laterally extensive clayey bed between 13 and 15 feet bgs. The more impervious clay units likely act as confining layers and inhibit the downward vertical migration of fluids. Based on this observation, the resulting perched groundwater in the upper permeable sand unit at 15 feet bgs has historically been independently sampled from the deeper water-bearing zone that is present at approximately 20 to 25 feet bgs (EBA, 2008). The predominant groundwater flow direction is approximately west-southwest across the project site towards Santa Rosa Creek (approximately 160 feet beyond the western side of the property). Therefore, the eastern portion of the project site is considered up gradient relative to the western portion (EBA, 2008b).

2.0 UST REMOVAL AND EXCAVATION

2.1 Scope of Work

In their agency letters (**Appendix A**), the RWQCB directed UPRR to remove the oil UST under permit from the Santa Rosa Fire Department (SRFD). The RWQCB also stated "If evidence of a discharge is revealed at the time of tank removal, contaminated soil must be removed from this area and depending upon the degree of the discharge, the impact to water quality may need to be investigated and remediated".

During the initial day-lighting activities of the oil UST, an additional 500-gallon UST containing oil was discovered adjacent and west of the known tank. UPRR's direct-bill contractor United Pumping Service, Inc. (UPS) evacuated, cleaned, and removed the second UST in conjunction with the known UST. **Section 2.4** contains details on the removal of the second UST.

2.2 Pre-Field Activities

Prior to initiation of field activities, Antea Group produced a Health and Safety Plan (HASP) in accordance with Title 8, Section 5192 of the California Code of Regulations. UPS obtained a UST removal permit for the original oil

UST prior to field activities. UPS obtained the UST removal permit for the second unknown UST during field activities. **Appendix C** includes copies of both UST removal permits.

2.3 Utility Clearance

UPS contacted Underground Service Alert (USA) North to mark the site for subsurface utilities. Additionally, Antea Group and UPS verified the locations of all previously known utilities (sewer and water) prior to subsurface work. **Figure 2** depicts the locations of these utilities.

2.4 UST Removals and Excavation

On November 1, 2011, Antea Group and UPS arrived on-site and located the single-walled steel 550-gallon oil UST. The UST was located approximately 55 feet east of the center on the adjoining warehouse building (60 West Sixth Street). While day lighting the original known UST (UST No. 1), UPS and Antea Group discovered an additional 500-gallon single-walled steel UST (UST No. 2) located approximately two feet west of the original UST. **Figure 3A** depicts the configuration of the USTs. UST No. 1 was empty, but UST No. 2 contained what appeared to be oil. UPS emptied UST No. 2 using a vacuum truck and collected a sample of the contents. Laboratory analytical reports (**Appendix D**) confirmed the contents of UST No. 2 to be primarily motor oil range hydrocarbons. Upon completion of evacuation activities, the USTs were fully day lighted, cut open and cleaned, and prepped with chain harnesses for removal.

UPS removed both USTs on November 2, 2011 under the direct observation of the Santa Rosa Fire Department (SRFD) and RWQCB. A Certified Industrial Hygienist (CIH) certified the tanks were clean, and UPS placed approximately 25 pounds of dry ice in each tank. Antea Group observed several 0.25-inch holes and numerous "pin-sized" holes on the northern end of UST No. 1 upon removal. Antea Group observed UST No. 2 to be in good condition, and did not observe any holes in the tank. UPS and Antea Group did not observe any markings or placards which indicated the tanks' age or origin. After removal of the tank, Antea Group observed visual soil staining in the bottom of the tank pit at approximately 4 feet bgs, particularly near the northern end of the USTs. UPS deepened the excavation to approximately 5 feet bgs. As directed by the SRFD, Antea Group then collected soil samples beneath the northern and southern ends of each tank, and from each sidewall. **Figure 3A** depicts the excavation limits and soil sampling locations on November 2, 2011. **Section 2.5** includes details regarding the soil sampling procedures and analyses.

UPS, under the direction of Antea Group, performed additional soil excavation on November 3, 2011 based on visual observation of stained soil. At approximately 12 feet bgs, the excavation activities appeared complete due to the lack of visual staining on the sidewalls and excavation bottom. Antea Group directed UPS to lower the excavation an additional 1-foot bgs to ensure the continuation of "clean" soil. At approximately 13 feet bgs, Antea Group observed what appeared to be heavily impacted soils judging by discoloration and a strong hydrocarbon odor. Antea Group directed UPS to begin removing the impacted soil by excavating deeper. At approximately 15

feet bgs, UPS encountered what appeared to be the capillary fringe, and was directed by Antea Group to stop excavating further. Soils encountered during excavation were primarily silty sand above the capillary fringe, and clayey sand and clay at the capillary fringe.

Upon completion of excavation activities, it did not appear the northern extent and vertical extent of impacted soil had been defined. At the conclusion of excavation activities, approximately 1 foot of groundwater was present in the bottom of the excavation. Antea Group observed the groundwater to have separate phase hydrocarbons (SPH) on the surface. Under the direction of SRFD and RWQCB, Antea Group collected a sample of the groundwater. **Section 2.6** includes details regarding groundwater sampling procedures and analyses. Antea Group also collected soil samples from each sidewall at approximately the halfway depth of the wall and at the soil-groundwater interface. **Figure 3B** depicts the final excavation limits and soil sampling locations on November 3, 2011.

On November 4, 2011, Antea Group and UPS returned to the site. Antea Group did not observe a significant rise in groundwater elevation within the excavation. UPS removed approximately 500 gallons of groundwater and SPH from the excavation using a vacuum truck. UPS then backfilled the excavation using clean large cobbles to stabilize to bottom portion of the excavation. The remaining portions of the excavation were backfilled with pea gravel and Class II backfill. On November 16, 2011, UPS removed the stockpiles of impacted soil from the site. **Section 2.7** includes details regarding the soil stockpiles, removal, and disposal.

2.5 Soil Sampling

As stated in **Section 2.4**, Antea Group collected soil samples from beneath each end of the tanks and from the sidewalls of the excavation. In accordance with the SRFD UST removal permits, Antea Group collected the samples using the United States Environmental Protection Agency (EPA) method 5035 with Encore® sampling devices. Antea Group also collected soil in a 16-ounce glass jar at each location for the analysis of metals. Soil samples retained for laboratory analysis were labeled, placed on ice, and recorded on the chain of custody form. Antea Group submitted all soil samples to Test America, Inc. (Test America), a California-certified analytical laboratory (No. 2496). The laboratory analyzed the tank and sidewall samples collected on November 2, 2011 for the following:

- Gasoline Range Organics (GRO), carbon chain range C_5 – C_{12}, by California LUFT method;
- Diesel Range Organics (DRO), carbon chain range C_{10} – C_{28}, and Motor Oil Range Organics (MORO), carbon chain range C_{24} – C_{36}, by EPA Method 8015B with Silica Gel Cleanup;
- Volatile Organic Compounds (VOCs) by EPA Method 8260B;
- Polycyclic Aromatic Hydrocarbons (PAHs) by EPA Method 8270C SIM; and

- Total metals cadmium, chromium, nickel, lead, and zinc by EPA Method 6010B.

The laboratory also analyzed samples collected on November 3, 2011 for the following:

- Total metals antimony, arsenic, barium, beryllium, copper, molybdenum, selenium, silver, and thallium by EPA Method 6010B; and
- Total mercury by EPA Method 7470A.

Antea Group also collected composite soil samples from the excavated soil stockpiles for analysis of the same constituents as the tanks and sidewall samples noted above. Based on the initial analytical results for total chromium, the laboratory analyzed two of these composite samples for Soluble Threshold Limit Concentrations (STLC) for chromium. **Appendix D** contains the certified laboratory analytical reports. **Table 1** summarizes the laboratory analytical results. Antea Group further discusses these results in **Section 2.8**.

2.6 Grab Groundwater Sampling

Approximately 1 foot of groundwater was present in the bottom of the excavation following soil removal activities. Under the direction of the RWQCB, Antea Group collected a grab groundwater sample from the excavation by lowering a disposable polyethylene bailer from the ground surface to the groundwater. Antea Group then decanted the groundwater into laboratory-supplied sampling containers. The grab groundwater sample was labeled, placed on ice, and recorded on a chain of custody form. Antea Group submitted the sample to Test America, a California-certified analytical laboratory (No. 2496). The laboratory analyzed the grab groundwater sample collected on November 3, 2011 for the following:

- GRO, carbon chain range C_5 – C_{12}, by California LUFT method;
- DRO, carbon chain range C_{10} – C_{28}, and MORO, carbon chain range C_{24} – C_{36}, by EPA Method 8015B with Silica Gel Cleanup;
- VOCs by EPA Method 8260B;
- Semi-Volatile Organic Compounds (SVOCs) by EPA Method 8270C;
- PAHs by EPA Method 8270C SIM;
- Total metals cadmium, chromium, nickel, lead, zinc, antimony, arsenic, barium, beryllium, copper, molybdenum, selenium, silver, and thallium by EPA Method 6010B; and
- Dissolved metals cadmium, chromium, nickel, lead, and zinc by EPA Method 6010B.

Appendix D contains the certified laboratory analytical reports. **Table 2** summarizes the laboratory analytical results. Antea Group further discusses these results in **Section 2.8**.

2.7 Disposal of Investigation Derived Waste

UPS pumped approximately 120 gallons of oil from the 500-gallon tank on November 1, 2011, and an additional 750 gallons of oily water were generated during tank cleaning. Approximately 500 gallons of oily groundwater was pumped from the excavation cavity on November 3, 2011. All liquid waste shipped as Non-RCRA Hazardous Waste to Demenno Kerdoon in Compton, California.

UPS stockpiled excavated soil on plastic sheeting adjacent, covered the soil stockpiles with plastic sheeting secured by sandbags, and placed straw waddles around the based of the stockpiles. The stockpiles were temporarily stored on-site, pending receipt of analytical results and waste characterization. UPS then transported the stockpiled soil off-site on November 16, 2011. A total of 213.03 tons of waste soil were generated during excavation activities. **Appendix D** includes the certified laboratory analytical reports for the waste characterization samples. **Table 1** includes the waste sampling analytical results. **Appendix E** includes copies of waste manifests. Additionally, the two USTs were transported to West Coast Metals in Windsor, CA for destruction/ recycling. The certificate of tank destruction/recycling is also included in **Appendix E**.

2.8 Analytical Results and Interpretation

Antea Group collected 16 soil samples and one grab groundwater sample from within the excavation. Additionally, Antea Group collected three composite soil samples from the stockpiles for waste characterization and disposal purposes. **Figures 3A and 3B** depict the locations of the excavation soil samples. Conestoga-Rovers and Associates (CRA) performed a complete data quality assessment and validation of the laboratory reports for soil and groundwater samples. **Appendix D** includes the certified laboratory analytical reports, CRA's lab report validation and COCs. **Tables 1 and 2** summarize the soil and groundwater sample analytical results from the excavation activities.

2.8.1 Soil Sampling Analytical Results and Interpretation

The analytical results from soil samples collected on November 2 and 3, 2011 are summarized in **Table 1.**

Samples collected on November 2, 2011 were from depths of 5-5.5 feet bgs. The soil sample analytical data from November 2, 2011 indicate the presence of impacted soil beneath the northern end of UST No. 1 and both ends of UST No. 2. Soil analytical data from the northern and western sidewalls also indicated the presence of impacted soil. Data shows that sample T2N, collected from 5 feet bgs, contained the maximum concentration of MORO (1,600 milligrams per kilogram [mg/kg]). In the shallow soil samples collected on November 2, 2011, DRO was detected at a maximum concentration of 300 mg/kg. GRO, VOCs, and PAHs were not reported above the laboratory reporting limit (LRL) in any of these samples. The locations of these sampling points were subsequently excavated on November 3, 2011.

The samples collected on November 3, 2011 (after additional excavation activities) did not report concentrations of GRO and MORO above the LRL. DRO was reported in several of these samples, ranging from 1.0 mg/kg in sample EWA (collected from 7 feet bgs) to 560 mg/kg (sample NWB, collected from approximately 15 feet bgs). Sample NWB was the only sample collected following further excavation that exceeded the San Francisco Bay RWQCB DRO Environmental Screening Levels (ESL) of 83 mg/kg where groundwater is a current or potential source of drinking water. The only VOC reported above the LRL was tetrachloroethene (0.0059 mg/kg in SWB at 15 feet bgs). This reported concentration did not exceed the ESL of 0.37 mg/kg. PAHs anthracene (0.015 mg/kg), chrysene (0.012 mg/kg to 0.023 mg/kg), fluorene (0.0054 mg/kg), phenanthrene (0.019 mg/kg to 0.023 mg/kg), and pyrene (0.0073 mg/kg to 0.021 mg/kg) were reported above the LRLs in the samples collected from NWB and SWB at 15 feet bgs. Naphthalene was reported in sample WWB at a concentration of 0.0052 mg/kg. The reported concentrations of PAHs did not exceed any of their respective ESLs for shallow or deep soil with residential land use. Only the reported concentrations of metals arsenic (4.0 mg/kg to 6.2 mg/kg) and vanadium (37 mg/kg to 62 mg/kg) exceeded ESLs (**Table 1**). However, the USGS reports background concentrations of arsenic and vanadium in the site vicinity at approximately 4.1 mg/kg and 70 mg/kg which are consistent with reported concentrations onsite (USGS 1984).

Based on the distribution of MORO, DRO, VOCs, and PAHs, it appears any release from the removed USTs only affected the immediate soils surrounding the USTs. In general, the soil samples collected on November 3, 2011 after additional excavation reported concentrations below the LRLs or significantly less than those reported from the November 2, 2011 samples (**Table 1**). However, there were two exceptions to this trend: sidewall samples NWB and SWB collected at 15 feet bgs. These samples reported VOCs and PAHs not reported in any other soil samples collected during the investigation. Since these samples were collected at the soil-water interface, Antea Group believes soil impact observed at these depths is due to impacted groundwater originating from outside of the excavation. This conclusion is supported by the fact that the groundwater sample collected from the excavation reported these PAHs and VOCs above the LRLs (**Section 2.8.2**). Laboratory data for the contents of UST No. 1 (removed October 2008) could not be located. Although the contents of UST No. 2 were not analyzed for PAH's, data shows that the contents of UST No. 2 did not contain VOCs.

2.8.2 Grab Groundwater Analytical Results and Interpretation

Table 2 summarizes the analytical results of the one grab groundwater sample collected from the excavation. As stated in **Section 2.4**, Antea Group observed separate phase hydrocarbons on the water encountered within the excavation. Laboratory analytical results show the groundwater is impacted by MORO (6,700 micrograms per liter [µg/L]), DRO (12,000 µg/L), acetone (50 µg/L), tetrachloroethene (1.2 µg/L), phenathrene (1.3 µg/L), chrysene (0.41 µg/L), pyrene (0.32 µg/L), and dissolved metals chromium (12 µg/L) and nickel (27 µg/L). Antea Group compared the reported concentrations of petroleum hydrocarbons, VOCs, and SVOCs to the ESLs for groundwater that is a current or potential source of drinking water:

Constituent	Reported Concentration (ug/L)	ESL (ug/L)
MORO	6700	100
DRO	12000	100
Acetone	50	1500
Tetrachloroethene	1.2	5.0
Phenathrene	1.3	4.6
Chrysene	0.41	0.35
Pyrene	0.32	2.0
Dissolved Chromium	12	50
Dissolved Nickel	27	8.2

As noted above, the reported concentration of MORO, DRO, chrysene, and dissolved nickel exceeded their respective ESLs.

Data from the initial soil sampling conducted on November 2, 2011 (**Section 2.8.1** and **Table 1**) did not report concentrations of VOCs or PAHs above the reporting limits. Two soil samples from the November 3, 2011 sampling event did contain reported concentrations of VOCs and PAHs, but these samples were collected from the capillary fringe and the reported concentrations may be attributed to groundwater trapped within the pore space of the soil during laboratory analysis (**Section 2.8.1**). Soils exhibiting staining were removed from excavation prior to additional excavation into the capillary fringe, where the deeper samples were collected. Following this additional excavation, MORO was not detected soil samples, and the highest DRO concentration was detected in NWB (at 15 feet bgs). All other post-excavation samples with DRO detections were below the ESL. Therefore, groundwater affected by VOCs and PAHs appears to be the result of a release from outside of the excavation area (**Appendix B**). Because metals are naturally occurring and/or may have been a product of a previous release, Antea Group cannot determine at this time if the reported concentrations of dissolved metals are due to the removed USTs.

3.0 CONCLUSIONS AND RECOMMENDATIONS

Based on information contained in this report, Antea Group makes the following conclusions:

- UPS and Antea Group removed two 500-gallon USTs from the site. UPS evacuated and disposed of the contents of UST No. 2 (oil).
- UPS excavated and disposed of approximately 213.03 tons of impacted soil surrounding the USTs, and pumped approximately 500 gallons of oil impacted groundwater from the excavation.
- Based on the distribution of MORO, DRO, VOCs, and PAHs, it appears that a release from the removed USTs only affected the immediate soils surrounding the USTs. Sidewall samples NWB and SWB collected at 15 feet bgs reported concentrations of VOCs and PAHs not found in any other samples collected. However, from the available data, soil VOCs and PAHs impacts appear to be the result of impacted groundwater within the capillary fringe, originating from outside of the excavated area, and not due to a release from the USTs.
- Metal concentrations in soil samples appear to be consistent with background levels.
- Laboratory analytical reports indicate groundwater observed in the excavation is impacted by petroleum hydrocarbons, VOCs, and PAHs.

4.0 REMARKS

The recommendations contained in this report represent Antea USA, Inc.'s professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This report is based upon a specific scope of work requested by the client. The contract between Antea USA, Inc. and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea USA, Inc.'s client and anyone else specifically identified in writing by Antea USA, Inc. as a user of this report. Antea USA, Inc. will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea USA, Inc. makes no express or implied warranty as to the contents of this report.

Information, conclusions, and recommendations provided by Antea Group in this document regarding the site have been prepared under the supervision of and reviewed by the licensed professional whose signature appears below.

San Rafael, CA 94901

Gentlemen:

Subject: Case Status
File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, Case No. 1TSR196

On January 16, 2009, the Southern Pacific Transportation Company case was reopened as a result of new discoveries reported in the November 2008 ***Report of Findings Sonoma-Marin Area Rail Transit Property*** and the January 7, 2009 ***Additional Information*** document prepared by EBA Engineering on behalf of Railroad Square Associates, LLC. The discoveries included an underground oil storage tank (UST), heavy hydrocarbon soil and groundwater impacts in the vicinity of soil boring SB-1, and shallow soil impacts.

Following receipt of this information, Regional Water Board staff requested that Union Pacific Railroad (UPR) and Sonoma Marin Area Rail Transit (SMART) remove the UST and submit two plans; a soil groundwater management plan to address shallow soil impacts and a work plan to address soil and groundwater impacts in the SB-1 area. The Railroad Square Associates LLC responded with the submittal of the ***Soil and Groundwater Management Plan*** and the ***Soil Excavation Work Plan*** on August 10, 2009 and October 14, 2009, respectively. For the record, Railroad Square Associates LLC is not a responsible party.

Subsequent written requests regarding tank removal were directed to UPR and SMART on May 27, 2009 and October 30, 2009. As of this date, efforts to remove the tank under permit from the Santa Rosa Fire Department have not been made.

This matter was discussed during the January 20, 2011 meeting held at the Carlile-Macy office in Santa Rosa including the relationship of land development

and completion of the environmental work. In summary, completion of the environmental work is critical for these reasons:

- Underground storage tank removal and excavation work plan implementation are required by law and regulation;
- Land development at the former railroad yard is dependent on the completion of the environmental work; and
- Some of the heavy hydrocarbon groundwater impacts beneath land to the west are likely the result of on site migration. Therefore, source removal work at the site is essential for water quality protection and to provide information regarding sources of groundwater impacts beneath other properties.

Two years have passed since the January 2009 letter, which is a generous amount of time to allow Union Pacific and SMART to resolve their legal interpretations regarding environmental liability issues. However, as I explained during our recent meeting, when progress is not made within a reasonable time frame, a compliance schedule must be established by the regulatory agencies. Proposed land development elevates the priority of a case.

Therefore, within 30-days of issuance of this letter, a written commitment and schedule is needed regarding your plans for tank removal and excavation work plan implementation. For your information, on January 31, 2011, I made another referral to Santa Rosa Fire Department to the attention of Mr. Mark McCormick (Interim Fire Chief) for enforcement of tank closure regulations.

I look forward to receipt of your written commitment and schedule followed by the timely removal of the underground storage tank. If you have any questions or would like to meet again to discuss this case, I can be reached at (707) 576-2675 and Jfleck@waterboards.ca.gov.

Sincerely,

c/o Mr. John Nemeth
750 Lindaro Street, Suite 200
San Rafael, CA 94901

Dear Mr. Nemeth:

Subject: Clarification of Regional Water Board staff letter of February 4, 2011
File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, Case No. 1TSR196

This letter serves as a written follow up of our July 13, 2011 phone conversation regarding the Regional Water Board staff letter dated February 4, 2011. In response to your request for clarification regarding the remaining work to be completed at the 3rd Street Property, I offer the following information:

Remaining work to be completed includes the:

1. Removal of the oil underground storage tank under permit from the Santa Rosa Fire Department.

   If evidence of a discharge is revealed at the time of tank removal, contaminated soil must be removed from this area and depending upon the degree of the discharge, the impact to water quality may need to be investigated and remediated. As stated in the February 4, 2011 letter, heavy hydrocarbon impacts to groundwater exist on and off site to the west and the tank may be a contributing source.

2. Removal of known shallow contaminated soil impacts.
3. Removal of shallow contaminated soil impacts encountered during property development.
4. Proper management of soil and groundwater during property development.

   A plan has been submitted to address these items, which is the August 2009 ***Soil and Groundwater Management Plan*** (SGMP) prepared by EBA Engineering on behalf of Railroad Square Associates LLC, who is not a responsible party.

Implementation of the soil and groundwater management plan will be a condition of property development and grading permit issuance. Implementation of the plan by someone other than EBA will require the identification of the licensed professional who will be in responsible charge of the project. Responsible parties may also submit their own SGMP.

5. Removal of impacted soil contamination in the area of B-1.

   Evidence of a surface discharge in the area of B-1 was reported in the November 2008 ***Report of Findings*** prepared by EBA Engineering. A plan has been submitted for the excavation of impacted soil in this area, which is the October 2009 ***Soil Excavation Work Plan*** prepared by EBA Engineering on behalf of the Railroad Square Associates LLC.

   The proposed scope of work must be implemented as soon as possible and prior to property development. Implementation of the plan by someone other than EBA will require the identification of the licensed professional who will be in responsible charge of the project. Responsible parties may also submit their own soil excavation work plan.

   Ground water impacts exist in the area of B-1. The extent will need to be defined and the impacts remediated.

If you have any questions or require further clarification, I can be reached at (707) 576-2675 and Jfleck@waterboards.ca.gov.

Sincerely,

Appendix B

Previous Investigation and Site History Summary

PREVIOUS INVESTIGATION AND SITE HISTORY SUMMARY

Over the history of environmental activities at the site, laboratories and consultants have used a wide variety of terms for petroleum hydrocarbons reported in analysis of soil and water. Soil and groundwater samples are analyzed typically by Environmental Protection Agency (EPA) method 8015B or 8260B. Antea Group uses the designation GRO for total petroleum hydrocarbons as gasoline within the C_5 to C_{10} carbon range, DRO for total petroleum hydrocarbons as diesel within the C_{10} to C_{28} carbon range, and RRO for total petroleum hydrocarbons as residual range organics (oil) within the C_{24} to C_{40} carbon range.

Terms from previous reports may include total recoverable petroleum hydrocarbons (TRPH), total purgeable petroleum hydrocarbons (TPPH) for GRO, total extractable petroleum hydrocarbons (TEPH) for DRO, and total volatile hydrocarbon (TVH) which refers to a broad carbon range. More specific historical terms are total petroleum hydrocarbons as gasoline (TPHg or TPH-G), total petroleum hydrocarbons as diesel (TPHd or TPH-D), and total petroleum hydrocarbons as oil or motor oil (TPHo, TPHmo, TPH-O, or TPH-MO). The designations are generally comparable to GRO, DRO, and RRO. Antea Group has left the original designation when summarizing historic data and the current designations when applied to recent investigations and summary discussions.

SITE HISTORY

In December 1987, Canonie Environmental Services Corporation (Canonie) removed three USTs from the site. These included a 230-gallon fuel oil UST, a 10,000-gallon diesel UST, and a 10,000-gallon gasoline UST, which were located within and northwest of the existing fenced enclosure. During UST removal activities, no holes or signs of leakage or overfilling were noted for any of the tanks. TPH were not detected above laboratory reporting limits in the soil samples collected from beneath the USTs (Industrial Compliance [IC], 1992).

In April 1990, the North Coast Regional Water Quality Control Board (RWQCB) drilled four borings in the western portion of the property and installed monitoring wells in two of the borings (MW-2 and MW-3). Monitoring well MW-3 was located approximately 100 feet down gradient (to the southwest) of the former fuel oil UST. Based on information presented in a July 1992 report by IC, analytical results for samples collected from the RWQCB borings showed that no petroleum hydrocarbons were present in soil samples collected from soil boring B-1. However, oil and grease was present in the soil sample collected from boring B-1 at 12 feet bgs at a concentration of 200 milligrams per kilogram (mg/kg). Additionally, this sample contained low concentrations of polynuclear aromatic hydrocarbons (PAHs). Soil samples collected at depths of 6 and 16 feet below ground surface (bgs) from soil boring MW-3 contained petroleum hydrocarbons quantified as diesel (TPHd) at concentrations of 11 and 30 mg/kg, respectively. No petroleum hydrocarbons were detected in the groundwater sample collected by the RWQCB from monitoring well MW-2; TPHd was detected at a concentration of 0.4 milligrams per liter (mg/l) in the groundwater sample collected at monitoring well MW-3 (Geomatrix Consultants, Inc. [Geomatrix], 2000).

Soil and grab groundwater samples were collected from five borings located near the former UST area by IC in 1992. No detectable concentrations of petroleum hydrocarbons, benzene, toluene, ethylbenzene, or xylenes

(BTEX compounds), or PAHs were reported in any of the soil samples collected. Grab groundwater samples collected from the location of the former diesel and gasoline USTs did not contain petroleum hydrocarbons or BTEX above laboratory reporting limits. The grab groundwater sample collected from the former fuel oil tank location reportedly contained TPHd at concentrations of 31 mg/l; no gasoline or BTEX compounds were detected in the grab groundwater sample collected from IC-B6 (Geomatrix, 2000).

The RWQCB destroyed monitoring wells MW-2 and MW-3 in June 1995. In November 1996, Geomatrix performed an investigation of soil and groundwater at the site to evaluate potential significant environmental impacts resulting from historical features or features identified during previous investigations and to respond to a request by the RWQCB to perform additional characterization in the vicinity of the former underground fuel oil tank. Twelve borings (SRB20 through SRB31) were drilled and samples were analyzed for TPHd, total petroleum hydrocarbons quantified as motor oil (TPHmo), PAHs, metals, and volatile organic compounds (VOCs). Soil samples collected for analyses of TPHd, PAHs, and metals were composited vertically from each boring; discrete samples subsequently were analyzed if elevated concentrations of constituents were detected. Only discrete samples were analyzed for VOCs. Petroleum hydrocarbons were detected in soil at elevated concentrations in boring SRB20 and SRB21, however the presence of petroleum hydrocarbons at these locations decreased with depth. Specifically, the shallower composite sample from SRB20 contained TPHmo at a concentration of 900 mg/kg. Discrete samples from depths of 4.0 and 6.5 feet contained TPHmo at concentrations of 69 mg/kg and less than 5 mg/kg, respectively. No TPHd was detected in soil samples from boring SRB20. In SRB21, TPHmo was present at a concentration of 510 mg/kg in the shallow composite sample; no TPHmo was detected in deeper, discrete samples from this boring. Shallow composite and deeper discrete soil samples from boring SRB21 contained TPHd, at a maximum concentration of 1,600 mg/kg. The concentration of TPHd in this boring decreased with depth and was not detected in the sample collected from 13.5 feet bgs (Geomatrix, 2000).

PAHs were detected in soil at concentrations below 1996 EPA screening criteria for industrial exposure. Concentrations of PAHs detected at this time are also below current PRGs (USEPA, 1999). For example, the maximum detected concentration of benzo(a)pyrene was 0.026 mg/kg in the discrete sample collected from a depth of 12.5 feet bgs in boring SRB22; the current PRG for benzo(a)pyrene is 0.29 mg/kg. The highest PAH concentration detected was in the discrete soil sample collected from a depth of 7 feet bgs in boring SRB22. In this sample, flourene was detected at a concentration of 0.87 mg/kg; the PRG for flourene is 33,000 mg/kg. Metals concentrations in soil were within expected background concentrations and less than 10 times the soluble threshold limit concentration (STLC)4 in all of the soil samples (discrete and composite). Concentrations of metals in soil samples also were below industrial PRGs. No TPHd, TPHmo, or VOCs were detected in groundwater above laboratory reporting limits. The results of the 1996 sampling program indicated no significant environmental issues at the site. However, based on its review of the results of the November 1996 work, the RWQCB requested that additional issues be addressed before case closure would be considered. These items, which are the focus of the work described herein, include additional evaluation of historical features, potential leachability of petroleum hydrocarbons, and groundwater quality at various site locations (Geomatrix, 2000).

In September 2001, five on-site and off-site groundwater monitoring wells were installed to characterize impacts to groundwater at the project site. A majority of wells were installed in the area of the aforementioned Santa Rosa Woolen Mills facility in the northwest portion of the project site. An up-gradient, single-screen monitoring well was installed on the eastern portion of the property in vicinity of the main line railroad tracks.

Extensive investigative activities were performed in 2002 on the northwest area of the project site at the historical location of the Santa Rosa Woolen Mills Facility. Soil samples collected as part of an investigation within this area reported significant concentrations of petroleum hydrocarbons present in soil and groundwater in the area of the fueling structures, the area of the former above ground fuel storage tank (AST), and the location of a former UST. Impacts to soil were identified as being primarily heavy range petroleum hydrocarbons. From June 2002 to November 2002, an additional characterization was performed in the northwestern area and a fenced enclosure at the property. Soil samples collected from these areas indicated significant concentrations of diesel and motor oil in soil. Proposed remedial options included excavation and removal of accessible impacted soil (EBA, 2008b).

In October and November 2003, approximately 6,500 cubic yards of impacted soil were removed from several areas of the project site. The most significant remediation efforts targeted the northwestern portion of the project site where several areas were excavated to remove impacted soil. Source removal activities began in the area of a former wooden UST that is indicated on historic Sanborn maps for the Santa Rosa Woolen Mills facility. During the excavation activities, remnants of the former UST were found and removed, whereupon the excavation was advanced to a total depth of approximately 18 feet bgs. A significant amount of free-phase petroleum hydrocarbon product was encountered on the groundwater surface during the excavation activities. The product and water was subsequently pumped, treated, and disposed of to the sanitary sewer. The excavation in this area, which resulted in the removal of approximately 700 cubic yards of impacted materials, proceeded to within 20 feet of the existing Sixth Street Warehouse and was subsequently terminated due to concerns of structure stability. Confirmation soil samples indicated that impacted materials containing significant concentrations of diesel and motor oil remained in place in the excavation sidewalls and groundwater in this area (EBA, 2008b).

Excavation activities in the northwestern portion of the property also included the removal off a fuel pipeline. The associated trench was enlarged as it encountered impacted materials in an area designated as the main pit excavation area. A total of 350 cubic yards of impacted materials were removed from this area. The excavation pit extended to depths below first encountered groundwater, which was encountered at approximately 19 feet bgs. The maximum depth attained by the excavation was approximately 22 feet bgs. Impacted groundwater encountered within the excavation pit, which included free-phase petroleum hydrocarbon product, was subsequently removed using pumps, treated, and disposed of to the sanitary sewer (EBA, 2008b).

Additional excavation was also performed on the south side of the aforementioned product line trench in the northwestern area. Approximately 325 cubic yards of impacted soil was removed from this area. Approximately 270 cubic yards of impacted soil was excavated and removed in the southwestern side of the project site identified as the “southern warehouse area” (EBA, 2008b).

Quarterly groundwater monitoring performed in the northwestern portion of the project site property and west into the neighboring property parcel indicated low levels of petroleum hydrocarbons in a monitoring well identified as SRMW-13 located in the northwest corner of the property. In addition, the fuel oxygenate methyl tert-butyl ether (MTBE) was detected in SRMW-8 located on the northeast side of the property. The remaining monitoring wells appear to have been relatively free of impacts during the time monitored (EBA, 2008b).

The RWQCB issued a *No Further Action* (NFA) letter for the previous case at the site on August 31, 2007. In 2008, Sonoma Marin Area Rail Transit District (SMART) granted an option to purchase the site, formerly owned by Northwestern Pacific Railroad Authority (NWRPA) to New Railroad Square Associates, LLC for transit-oriented development purposes. In anticipation of property ownership for the site, New Railroad Square Associates, LLC (with consent from SMART) contracted the services of EBA Engineering (EBA) to perform environmental assessment activities. EBA's November 2008 *Comprehensive Report on Findings* concluded that on-site hazardous materials presently exist at various locations on the property. These materials include an underground oil storage tank (UST), heavy hydrocarbon soil and groundwater impacts in the vicinity of soil boring SB-1, and impacted shallow soil across the site. The RWQCB reopened the environmental case for the site on January 16, 2009 based on EBA's findings.

SENSISTIVE RECEPTORS

Geomatrix performed a well survey in 2000. Domestic and industrial water supply for the site vicinity is provided through the City of Santa Rosa, which purchases water from the Sonoma County Water Agency (SCWA). The SCWA delivers water to the City via the Sonoma County aqueduct. The source of the water is the Russian River, which is fed by three main upstream reservoirs. The City of Santa Rosa also has eight standby wells to pump groundwater for emergency purposes; these wells currently are not in use (Geomatrix, 2003).

Information provided by the City of Santa Rosa Utilities Department (SRUD) indicates that 50 groundwater wells are located within a half mile of the site. Of these wells, 21 are located within a half mile generally to the north (hydraulically up- and cross-gradient of the site) and 29 are located within a half mile generally to the south (hydraulically down-gradient of the site). Of the 50 wells, only four are located within a one-quarter mile radius, with two wells located approximately up gradient and two approximately down gradient. Based on conversations with SRUD personnel, only two of the residences located within one-half mile from the site are not connected to the City of Santa Rosa water supply. These residences are located at 654 and 658 Dutton Avenue. Uses for the wells are not tracked by SRUD in all cases, but records indicate that the wells within one-quarter mile of the site are used for irrigation and external use (Geomatrix, 2003).

Information about the possible presence of an additional water producing well located near the site was provided by the RWQCB. This well was not included in the SRUD database. The well is located to the west of the site between the site and Santa Rosa Creek; its actual location has not been field-verified. At this time the well is not in

use, and based on a conversation with the site redeveloper, the well will not be used in the future and will be appropriately destroyed (Geomatrix, 2003).

City of Santa Rosa

FAX COVER SHEET

DATE: 11-29-11

PLEASE DELIVER THE FOLLOWING 2 PAGES (INCLUDING COVER SHEET) TO:

NAME: Nicole - United Pumping

FAX#: 626-336-7734

FROM: Judy Tapparo

DEPT: Santa Rosa Fire

FAX#: (707) 543-3520

PLEASE CALL OUR BUSINESS OFFICE AT (707)543-3500 IF YOU HAVE ANY QUESTIONS.

THANK YOU.

COMMENTS:

The 2nd tank was added to the original permit.

Call with any questions.

THIS PERMIT HAS BEEN REVIEWED AND DETERMINED TO BE:

(X) **APPROVED** w/conditions

NOTE: Please review the comments and make corrections, changes and/or additions as required. Approval of this plan does not approve any omission or deviation from the applicable regulations. Final approval is subject to field inspection. Approved plans shall be on site and available for review at all times.

Item #	Code Section	Comments	Correction
1		Santa Rosa Fire Department must be on site to witness tank/piping removal and soil sampling. The following analytical must be performed (at a minimum) for all samples samples: TPHg, TPHd, TPHmo, BTEX, MTBE, LUFT 5Metals. EPA method 5035("EnCore" type) sampling is required in accordance with the North Coast Regional Water Quality Control Board.	
2		State Water Resources Control Board Form: *Tank Certificate of Compliance* (one per tank)	Provide day of removal
3		During over excavation activities, if contamination is found to exist beyond the scope of this work plan, the City protocol will be followed to clean the site to the extent feasible or to non-detect. This may involve areas that are not within the scope of the contract of UST removal. A separate soil remediation permit will be required.	
4		Authorization must be received from the Fire Department Inspector prior to backfill. Backfill will be based upon field conditions and analytical results once received by Santa Rosa Fire Department.	

5		A final tank removal/sampling/remediation report must be submitted to the Fire Department for review and approval. The report must contain, in part, analytical data, site plan and manifests for soil and/or groundwater.	
6		A required fire extinguisher must be on site and shall bear a current State Fire Marshal service tag. The fire extinguisher must have a minimum rating of 3A40BC. **Provide on Site.**	
7		A Santa Rosa Fire Department Inspector must be scheduled for all inspections listed on the permit. Log on to www.velocityhall.com to schedule inspections online **or** Call the Selectron Automated Request System at (707) 543-3006 to schedule each inspection no more than 48 hours in advance. Submit any and all test reports to the SRFD for review and approval within 30 days of test.

RE: Data Quality Assessment and Validation of Reports J38467 & J38506
UST Tank Pull
CA-2 Fourth Street and 34 Sixth Street
Santa Rosa, CA
November 2011

INTRODUCTION

The following details a quality assessment and validation of the analytical data resulting from the November 2011, collection of soil and water samples in Santa Rosa, CA. Samples were submitted to Test America Laboratories (TA), in Pleasanton, CA, and analyzed for the following:

Parameter	*Methodology*
Volatile Organic Compounds (VOCs)	SW846 8260B
Semi-Volatile Organic Compounds (SVOCs)	SW846 8270C SIM
Gasoline Range Organics (GRO)	CA LUFT GC/MS
Diesel Range Organics (DRO)/Motor Oil Range Organics (ORO)	SW846 8015B
Metals	SW846 6010B
Mercury	SW846 7470A/7471A

The analytical results are summarized in Tables 1A and 1B. The QC criteria used to assess the data were established by the methods and with the following guidance documents:

i) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", USEPA 540/R-99/008, October 1999

ii) "USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Review", USEPA 540/R-94/013, February 1994

These guidelines are collectively referred to as "Guidelines" in this memorandum.

SAMPLE QUANTITATION

The laboratory did not report any detected concentrations below the laboratory's practical quantitation limit (PQL)/report limit (RL).

SAMPLE PRESERVATION AND HOLDING TIMES

Sample holding time periods and preservation requirements are summarized in the analytical methods. All sample extractions and/or analyses were performed within the specified holding times.

All samples were properly preserved and cooled after collection.

METHOD BLANK SAMPLES

Method blank samples are prepared from a purified sample matrix and are processed concurrently with investigative samples to assess the presence and the magnitude of sample contamination introduced during sample analysis. Method blank samples are analyzed at a minimum frequency of one per analytical batch and target analytes should be non-detect.

Method blanks were analyzed at the recommended frequency and all results were non-detect for the compounds of interest.

SURROGATE COMPOUNDS – ORGANIC ANALYSES

Individual sample performance for organic analyses was monitored by assessing the results of surrogate compound percent recoveries. Surrogate percent recoveries are reviewed against the laboratory developed control limits provided in the analytical report.

All surrogate recoveries met the method criteria, demonstrating acceptable analytical efficiency for these analyses with a few exceptions. All samples with surrogate recoveries outside of the acceptable limits were diluted greater than or equal to five times. The sample results would not have been impacted, no qualification of the data was deemed necessary.

LABORATORY CONTROL SAMPLE (LCS)

The LCS analysis serves as a monitor of the overall performance in all steps of the sample analysis and are analyzed with each sample batch. The LCS percent recoveries were evaluated against method and laboratory established control limits.

Laboratory control samples (LCS) were analyzed in duplicate for all parameters. All recoveries were within required control limits showing adequate analytical accuracy and precision with one exception. Several sample results were qualified as estimated (See Table 2).

MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) ANALYSES

To assess the long term accuracy and precision of the analytical methods on various matrices, MS/MSD percent recoveries and relative percent differences (RPD) of the concentrations were determined. The

organic MS/MSD percent recovery and RPD control limits are established by the laboratory. The inorganic control limits are defined by the methods and the "Guidelines", which require recoveries between 75 to 125 percent with RPDs less than 20 percent for water samples and 30 percent for soil samples.

Matrix spikes (MS) were prepared and analyzed in duplicate for VOCs, DRO/ORO, metals and mercury. All recoveries were within required control limits showing adequate analytical accuracy and precision with a few exceptions. One sample result was qualified as estimated (See Table 3). Precision for SVOCs was determined to be acceptable based on LCS/LCSD recoveries.

FIELD QUALITY ASSURANCE/QUALITY CONTROL (QA/QC)

No field QA/QC samples were submitted to the laboratory for analysis.

OVERALL ASSESSMENT

The data were found to exhibit acceptable levels of accuracy and precision, based on the provided information, and may be used with the qualifications noted.

TestAmerica Job ID: 720-38467-1

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 720-38467-1

Laboratory: TestAmerica San Francisco

Narrative

Job Narrative
720-38467-1

Comments
No additional comments.

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
Method 8260B: Internal standard responses were outside of acceptance limits for the following sample: SO-2344-WW (5)-021111 (720-38467-3). The result was confirmed by re-analysis.

Method 8260B: Internal standard responses were outside of acceptance limits for the following sample 720-38467-7. The sample shows evidence of matrix interference; confirmed by re-analysis.

No other analytical or quality issues were noted.

GC/MS Semi VOA
Method 8270C SIM: The following sample was diluted due to the abundance of non-target analytes: SO-2344-NW (5)-021111 (720-38467-2), SO-2344-T1N (5)-021111 (720-38467-9), SO-2344-T2N (5)-021111 (720-38467-7), SO-2344-WW (5)-021111 (720-38467-3). Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

GC VOA
No analytical or quality issues were noted.

GC Semi VOA
Method 8015B: Due to the level of dilution required for the following sample, surrogate recoveries are not reported: SO-2344-WW (5) -021111 (720-38467-3), SO-2344-T2N (5)-021111 (720-38467-7), SO-2344-WESTSP-(COMP)-021111 (720-38467-10).

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.
