Sharma, Dimple

From: Lia Holden [Lia.Holden@anteagroup.com]
Sent: Thursday, November 03, 2011 7:22 AM
To: Sharma, Dimple
Subject: UPRR-Santa Rosa

Hi Dimple,
Yesterday, Steve submitted 9 to 10 soil samples. Most were placed on 72 hr TAT; one was held. I need the results of that held sample on a 24 hr TAT.

Please confirm. Thanks Dimple.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

TestAmerica Job ID: 720-38506-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD exceeds the control limits

GC Semi VOA

Qualifier	Qualifier Description
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
Sample for metals analysis does not appear to be field filtered.. Gave to lab to filter.

All other samples were received in good condition within temperature requirements.

GC/MS VOA
Method 8260B: Internal standard responses were outside of acceptance limits for the following sample: SO-2344-NWB(15)-031111 (720-38506-8). The results were confirmed by re-analysis.

Method 8260B: The laboratory control sample (LCS) and / or the laboratory control sample duplicate (LCSD) for batch #102299 exceeded control limits for the following analytes: Bromobenzene.

No other analytical or quality issues were noted.

GC/MS Semi VOA
No analytical or quality issues were noted.

GC Semi VOA
Method 8015B: Due to the level of dilution required for the following sample, surrogate recoveries are not reported: SO-2344-NWB(15) -031111 (720-38506-8).

No other analytical or quality issues were noted.

Metals
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Subject: RE: Sample Login Confirmation for 720-38506, UPRR- Santa Rosa
Importance: High

Hello Dimple,
Please run all soil samples on this COC (Including rushed samples) for PAHs and VOCs. If you cannot report PAHs on the rush samples until later, just include the PAHs for the samples in the final standard TAT report.

Additionally, please run the three rush samples on this COC (two soil, one waste water) for CAM 17 metals, rather than LUFT 5. I understand that mercury may not be ready until Monday, but get us what you can today so that we can arrange for transport/disposal as quickly as possible. Metals in water must be total metals.

Thanks Dimple,

Please call me if anything here isn't clear.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Definitions/Glossary

Client: Antea USA, Inc.
Project/Site: UPRR- Santa Rosa

TestAmerica Job ID: 720-38506-2

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
F	RPD of the MS and MSD exceeds the control limits
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 720-38506-2

Comments
No additional comments.

Receipt
Sample for metals analysis did not appear to be field filtered. Filtered in the lab for metals..

All other samples were received in good condition within temperature requirements.

GC/MS VOA
No analytical or quality issues were noted.

GC/MS Semi VOA
No analytical or quality issues were noted.

GC VOA
No analytical or quality issues were noted.

GC Semi VOA
Method 8015B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for batch 102284 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

Metals
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for prep batch 102289 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Subject: RE: Sample Login Confirmation for 720-38506, UPRR- Santa Rosa
Importance: High

Hello Dimple,
Please run all soil samples on this COC (Including rushed samples) for PAHs and VOCs. If you cannot report PAHs on the rush samples until later, just include the PAHs for the samples in the final standard TAT report.

Additionally, please run the three rush samples on this COC (two soil, one waste water) for CAM 17 metals, rather than LUFT 5. I understand that mercury may not be ready until Monday, but get us what you can today so that we can arrange for transport/disposal as quickly as possible. Metals in water must be total metals.

Thanks Dimple,

Please call me if anything here isn't clear.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
Sample for metals analysis does not appear to be field filtered.. Gave to lab to filter.

All other samples were received in good condition within temperature requirements.

GC/MS Semi VOA
No analytical or quality issues were noted.

Metals
Method 3010A: The following sample(720-38506-L-11) submitted for metals analysis was received with insufficient preservation (pH >2): preseved the sample on 11/4/11@11:40am w/nitric loT J4103

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Subject: RE: Sample Login Confirmation for 720-38506, UPRR- Santa Rosa
Importance: High

Hello Dimple,
Please run all soil samples on this COC (Including rushed samples) for PAHs and VOCs. If you cannot report PAHs on the rush samples until later, just include the PAHs for the samples in the final standard TAT report.

Additionally, please run the three rush samples on this COC (two soil, one waste water) for CAM 17 metals, rather than LUFT 5. I understand that mercury may not be ready until Monday, but get us what you can today so that we can arrange for transport/disposal as quickly as possible. Metals in water must be total metals.

Thanks Dimple,

Please call me if anything here isn't clear.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DL, RA, RE, IN	Indicates a Dilution, Reanalysis, Re-extraction, or additional Initial metals/anion analysis of the sample
EDL	Estimated Detection Limit
EPA	United States Environmental Protection Agency
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
RL	Reporting Limit
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Subject: RE: Files from 720-38506-2 UPRR- Santa Rosa

Hi Dimple,

Soil samples: Please run STLC on chromium and vanadium.

Could you cc Bob Rico on the results as well?

We will need a 24 hr turn around on the STLC results.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

THE LEADER IN ENVIRONMENTAL TESTING

ANALYTICAL REPORT

Job Number: 720-38430-1

Job Description: UPRR-Santa Rosa

For:
United Pumping Service
14000 Valley Boulevard
City of Industry, CA 91746

Attention: Mr. Bob Rico

Approved for release.
Dimple Sharma
Project Manager I
11/2/2011 5:21 PM

Dimple Sharma
Project Manager I
dimple.sharma@testamericainc.com
11/02/2011

CA ELAP Certification # 2496
The Chain(s) of Custody are included and are an integral part of this report.
The report shall not be reproduced except in full, without the written approval of the laboratory. The client, by accepting this report, also agrees not to alter any reports whether in the hard copy or electronic format and to use reasonable efforts to preserve the reports in the form and substance originally provided by TestAmerica.
A trip blank is required to be provided for volatile analyses. If trip blank results are not included in the report, either the trip blank was not submitted or requested to be analyzed.

Job Narrative
720-38430-1

Comments
No additional comments.

Receipt
All samples were received in good condition within temperature requirements.

GC/MS VOA
No analytical or quality issues were noted.

GC Semi VOA
Method 8082: The following sample was diluted due to color, appearance, viscosity, etc.>>: 001 (720-38430-1). Elevated reporting limits (RL) are provided.

No other analytical or quality issues were noted.

Metals
Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for prep batch 102078 were outside control limits. The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method 6010B: The following sample was diluted due to the nature of the sample matrix: 720-38430-a-1. Elevated reporting limits (RLs) are provided.

Method 7471A: The following sample was diluted due to the nature of the sample matrix: 720-38430-a-1. Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Question	Answer	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	True

Santa Rosa, California
North Coast Regional Water Quality Control Board
Case Nos. 1TSR19 and 1NSR196

1.0 INTRODUCTION

Antea™Group has prepared this *Well Abandonment Work Plan* to outline proposed abandonment procedures for the proper destruction of well SRMW-08, located at the above referenced site. This work is being conducted to prevent the improper abandonment of (or uncontrolled damage to) this existing monitoring well. On February 11, 2012, Antea Group and Union Pacific Railroad (UPRR) received notification from the property owner, Sonoma Marin Area Rail Transit District (SMART), that construction at the site is occurring. A train station platform is currently being constructed on the location of this existing well. The North Coast Regional Water Quality Control Board (NCRWQCB) approved the abandonment of this well in an email dated February 12, 2013 (**Appendix A**).

2.0 SITE LOCATION AND DESCRIPTION

Currently, the majority of the site is used as a construction equipment and supply storage area for SMART during offsite construction activities. Additionally, onsite construction activities are occurring in the northern portion of the property. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03. (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the 3 West Third Street and 60 West Sixth Street Warehouses, to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties. A site location map is provided as **Figure 1** and a site plan is provided as **Figure 2**.

3.0 PRE-FIELD ACTIVITIES

Prior to initiating field activities, Antea Group will ensure that the Health and Safety Plan (HASP) is updated for the current field tasks and prepared in accordance with Title 8, Section 5192 of the California Code of Regulations. The HASP will contain a list of emergency contacts, potential contaminants, personal protective equipment requirements, and a hospital route map to the nearest emergency facility. The HASP will be reviewed daily by field personnel.

Antea Group will contact Underground Service Alert and UPRR's Fiber Optic Hotline to mark the site for subsurface utilities. Well destruction permits will be obtained from the Sonoma County Department of Health Services, Environmental Health Division. The permit application is included as **Appendix B.**

4.0 GROUNDWATER MONITORING WELL ABANDONMENT

One (1) onsite groundwater monitoring wells (SRMW-08) will be destroyed by drilling out the well to its total constructed depth of 22 feet below ground surface (bgs). Drilling will be conducted by a licensed C-57 contractor. Prior to drilling, an air knife (vacuum) rig will clear the upper five feet of soil surrounding the well to expose potentially unmarked utilities and prevent utility damage during auger advancement. The well casing, filter pack, and backfill materials will be removed by advancing eight-inch diameter hollow-stem augers to the total constructed well depth (22 feet bgs). After removing the well casing and annular material, the bore will be backfilled with neat cement grout through a tremie pipe to just below ground surface, then capped with concrete at the surface. The boring log illustrating the well's original construction detail is provided as **Appendix C**.

5.0 DISPOSAL OF INVESTIGATION DERIVED WASTE

Soil cuttings, construction debris, and wastewater generated during well destruction activities will be placed in Department of Transportation (DOT) approved 55-gallon drums, sealed and labeled in accordance with the corresponding DOT protocols for non-hazardous waste. The drums will be temporarily stored on-site pending waste profiling, then transported by United Pumping, Inc. and disposed of at a licensed facility. Final non-hazardous waste manifests will be submitted with the well destruction report following completion of field activities.

6.0 SCHEDULE/REPORTING

The abandonment of SRMW-08 is scheduled to occur Friday, February 15, 2013. A summary letter/report documenting well abandonment activities will be issued upon receipt of the final executed waste manifests, estimated to be received within 45 days of the completion of field activities.

The activities outlined in this work plan and the preparation of the corresponding report will be conducted under the direction of a licensed California Professional Geologist. In accordance with the California State Water Resources Control Board requirements, the well abandonment report and site plan (showing the well as destroyed) will be uploaded to the GeoTracker database under both of the site's case numbers.

7.0 REMARKS

The findings contained in this document represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. For any reports cited that were not generated by Antea USA, Inc., the data from those reports are used "as is" and is assumed to be accurate. Antea USA, Inc does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. This document is based upon a specific scope of work requested by the client. Cc: Matt Villaber (Matt.Villaber@sonoma-county.org)
Subject: RE: Southern Pacific Site, Third Street, Santa Rosa: Abandonment February 15
Date: Tuesday, February 12, 2013 11:29:19 AM

Lia,

Thanks for the update on the well abandonment and for your quick response to properly abandon the well. As we have discussed, our office is in agreement with well abandonment due to the circumstances with development of the site. If you need any assistance with this project, please let me know.

Regards,

Janice

Subject: RE: Southern Pacific Site, Third Street, Santa Rosa: Abandonment February 15

Please note…abandonment is for THIS **Friday, February 15**, not February 22.

Thanks again!

Hi Janice,
Per our telephone conversations, and your verbal approval, we plan to conduct an "emergency" abandonment of well SRMW-08 this Friday, February 15. This is an upgradient well, in the path of site development activities that were schedule to occur this week. Matt at Sonoma County Environmental Health has kindly agreed to expedite the abandonment permit. Their office is closed today, but I will complete the well abandonment work plan and permit application today for his processing tomorrow. SMART has agreed to pay for the well abandonment permit.

Janice and Matt, I greatly appreciate your assistance and in working with us on such short notice.

Thank you!

Lia

Site Investigation and Well Abandonment Work Plan

Union Pacific Railroad
2 Fourth Street and 34 Sixth Street, Santa Rosa, California
North Coast Regional Water Quality Control Board
Case Nos. 1TSR19 and 1NSR196

1.0 INTRODUCTION

Antea®Group has prepared this *Site Investigation and Well Abandonment Report* on behalf of Union Pacific Railroad (UPRR) in response to the North Coast Regional Water Quality Control Board (NCRWQCB) correspondence letters contained in **Appendix A**. This report documents the recent installation of groundwater monitoring wells MW-1 through MW-4, the abandonment of wells SRMW-07 and SRMW-08, and the associated soil and groundwater sampling.

1.1 Site Description

The site is currently owned by Sonoma Marin Area Rail Transit (SMART) and is used as an equipment and supply storage area for SMART construction activities taking place off site. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the "3 West Third Street and 60 West Sixth Street Warehouses", to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties (**Figure 1**).

1.2 Site History

The site was historically used as a railroad freight depot and maintenance/fueling yard from the late 1800's through the 1960's. This site has been vacant and generally unused since the late 1960's. Consultants have conducted environmental investigations and remediation efforts at the site since 1987. Former operations at the site include the use of aboveground storage tanks (ASTs), underground storage tanks (USTs), a main railroad track system that occupied the eastern portion of the property, several associated railroad spurs and siding, a turntable, warehouses, and freight houses. A Sanborn Fire Insurance map dated 1885 indicates the Santa Rosa Woolen Mills was located in the northwestern portion of the site until approximately 1906 (EBA Engineering (EBA), 2009a). The site's previous environmental case was closed in 2007, but was reopened in 2009 following the discovery of an underground storage tank in 2008. **Appendix B** includes a summary of environmental investigations and remedial activities conducted at the site. **Figure 2** shows the site's historic borings and well location.

1.3 Geologic and Hydrogeologic Setting

1.3.1 Regional Geology

The site is centrally located within the Santa Rosa Plain, which is part of the Coast Range Geomorphic Province of northern California. The Coast Range Geomorphic Province is characterized as a series of northwest trending elongated ridges and valleys that are a result of folding and faulting. The Santa Rosa Plain consists of alluvial fan deposits of Pleistocene and Holocene age. The alluvial fan deposits form a nearly continuous blanket over the Santa Rosa Plain and consist of poorly sorted coarse sand and gravel, moderately sorted fine sand and silt, and silty clay. The region has been mapped as having basement materials that underlie the alluvial fan deposits. The basement materials consist of marine sedimentary rocks of the Miocene Age Wilson Grove Formation. Portions of the Wilson Grove Formation are overlain by younger continental sedimentary rocks of the Pliocene-Pleistocene Age Glen Ellen Formation (EBA, 2008b).

1.3.2 Site Geology and Hydrogeology

The geology of the project site is characterized by shallow rocky fill or organic clay in the upper one to two feet below ground surface (bgs) that is underlain by sandy silt and clayey sediments containing varying amounts of angular to sub-rounded gravel. These finer-grained sediments extend to approximately 20 feet bgs, and are underlain by a laterally continuous sandy coarse-grained unit extending to a minimum of 26 feet bgs, which is the maximum depth explored at the project site to date (EBA, 2008b).

The hydrogeology of the project site is likely controlled by gradational lenses of sediments separated by clayey layers. A thin, semi-continuous sandy unit located at an average depth of approximately 9-15 feet bgs overlays a similarly laterally extensive clayey bed. The more impervious clay units likely act as confining layers inhibiting the downward vertical migration of fluids. Based on this observation, the resulting perched groundwater in the upper permeable sand unit (Zone A) has been independently sampled from the deeper water-bearing zone present at a depth of approximately 20 to 25 feet bgs (EBA, 2008). However, as EBA previously noted, wells SRMW-7 and SRMW-8 were screened across both zones. The predominant groundwater flow direction is approximately west-southwest across the project site towards Santa Rosa Creek (approximately 160 feet beyond the western side of the property). Therefore, the eastern portion of the project site is considered up gradient relative to the western portion (EBA, 2008b).

2.0 SCOPE OF WORK

As stated in the introduction, Antea Group addressed RWQCB directives by conducting the following activities:

Well Abandonments (SRMW-07 and SRMW-08): Due to SMART's track expansion and proposed on-site developments, monitoring wells SRMW-07 and SRMW-08 needed to be abandoned. Both wells were installed prior to the site's initial 2007 case closure. These wells were screened across two water-bearing

zones and no longer used for sample collection. Antea Group abandoned the monitoring wells during two separate events.

- **Well Installations (MW-1 through MW-4):** Antea Group installed four groundwater monitoring wells to further investigate the groundwater impacts from both on and off-site petroleum use and storage. The monitoring wells were subsequently surveyed, developed and sampled.

2.1 Pre-field Activities

Prior to initiating field activities, Antea Group produced a Health and Safety Plan (HASP) in accordance with Title 8, Section 5192 of the California Code of Regulations. The HASP contained a list of regulatory and emergency contacts, as well as a hospital route map to the nearest emergency facility. Field personnel conducted a daily review of the HASP for site-specific updates or changes in work conditions. Antea Group obtained all necessary soil boring permits from Sonoma County for well abandonment and installation activities. In addition, Antea Group conducted pre-field notifications, as required by the regulatory and permitting agencies. **Appendix C** includes copies of the permits obtained from County of Sonoma – Department of Health Services.

Prior to drilling, Antea Group conducted a site visit to mark the planned drilling locations as required by Underground Service Alert (USA). Antea Group called USA and utilized a private utility locating service to clear boring locations and further minimize the potential for encountering subsurface utilities during well installation and abandonment.

2.2 Well Abandonments

Prior to drilling for well abandonment, the first five feet (or more, in instances where utilities are suspected in close proximity) of each borehole were cleared with an air-knife and vacuum rig, or hand auger surrounding the existing well. This was conducted as an added safety measure to avoid encountering subsurface utilities. Destruction of SRMW-07 and SWMW-08 occurred on February 15, 2013 and May 15, 2013, respectively. Each well was drilled out to its original bore depth using 8-inch diameter augers. Subsequent to removing the well casing, the boreholes were backfilled (grouted) to the surface with neat cement. Backfilling continued until the level of grout within the former well bore stabilized (until the grout level did not decrease). Antea Group has completed and submitted the Well Completion Forms to the Department of Water Resources (DWR) and the County of Sonoma – Department of Health Services.

2.3 Groundwater Monitoring Well Installation

On May 5 and 6, 2013, Antea Group installed four groundwater monitoring wells (MW-1 through MW-4). Following airknife and vacuum clearing to five feet bgs, Gregg Drilling and Testing advanced 8-inch hollow stem augers to approximately 20 feet bgs. Monitoring well casings for MW-1 and MW-2 were set at depths of 20 feet bgs; casing depths for MW-3 and MW-4 were set at 18.5 feet bgs. Each of the four wells screened with 10-foot long screen interval using 0.020-inch slotted casing.

The locations of monitoring wells MW-1 through MW-4 are shown on **Figure 2**. **Appendix D** includes the standard procedures for hollow stem auger drilling and groundwater construction, equipment decontamination, and waste handling and disposal.

Antea Group field screened the soil samples at approximate 5-foot depth intervals using a pre-calibrated Photo Ionization Detector (PID). PID readings were recorded on each boring log. **Appendix D** includes the standard organic vapor procedures. Soil in each well bore was classified using the United Soil Classification System. **Appendix E** includes the boring logs and well construction information for the four monitoring wells. Cross Sections with lateral interpretations are included as **Figures 3 and 4**.

Samples were retained for laboratory analysis from approximately 5 feet and 10 feet bgs in all soil borings. The 5-foot samples were collected to obtain a representative shallow soil samples in addition to collecting data for lateral comparison to data from previous assessments. The approximate 10-foot interval samples were collected to assess soil conditions at the groundwater-soil interface. An additional soil sample was obtained from 16 feet bgs in MW-1 as this well was installed nearest the former UST excavation area.

Soil samples were collected in glass jars, capped, packed with ice and submitted to TestAmerica Laboratories, Inc. (TestAmerica), located in Pleasanton, California and analyzed for the following:

- Diesel range organics (DRO) by Environmental Protection Agency (EPA) Method 8010B with silica gel clean-up,
- motor oil range organics (MORO) by EPA Method 8010B with silica gel clean up, and
- polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270C SIM.

Soil analytical results are summarized in **Table 1** and discussed in Section 4.1.

2.4 Groundwater Monitoring Well Survey and Development

Antea Group subcontracted Morrow Surveying (Morrow) to survey the new wells on May 17, 2013. Morrow surveyed the northing/easting, latitude/longitude and elevation (accurate to the nearest 0.01 foot) of the new wells using North American Datum (NAD) 83. The survey report is contained in **Appendix F**. The survey data will be uploaded into the State of California GeoTracker database with this report.

On May 20, 2013, Blaine Tech Services, Inc. (Blaine Tech), developed newly-installed monitoring wells MW-1 through MW-4 by surging the screened interval with a 2-inch diameter surge block and then purging a minimum of 10 well casing volumes via electric submersible pump. Blaine Tech recorded depth to water, purge rate, temperature, conductivity, turbidity, and pH during development activities. **Appendix G** includes Blaine Tech's well development field sheets.

2.5 Groundwater Monitoring Well Sampling

On May 29, 2013, Blaine Tech gauged and purged/sampled each well. **Appendix H** includes copies of Blaine Tech's well sampling data sheets; the following table presents a summary of the recent gauging and sampling information.

Well gauging and sampling date:	May 29, 2013
Wells gauged and sampled	MW-1 through MW-4 **(Table 2)**
Purge method:	Low flow via peristaltic pump
Sample collection method:	New tubing and peristaltic pump
Groundwater parameters measured (**Appendix B**):	Temperature, pH, Conductivity, Oxidation-reduction potential (ORP), Turbidity, Dissolved Oxygen (DO) and Depth to water (DTW)
Wells with measurable LNAPL:	None

Blaine Tech submitted groundwater samples collected on May 29, 2013, under chain-of-custody protocol to TestAmerica. Groundwater samples were analyzed for the following:

- Diesel range organics (DRO) by Environmental Protection Agency (EPA) Method 8010B with silica gel clean-up,
- motor oil range organics (MORO) by EPA Method 8010B with silica gel clean up, and
- polycyclic aromatic hydrocarbons (PAHs) by EPA Method 8270C SIM.

Groundwater analytical results are presented in **Table 2** and discussed in Section 3.2.

3.0 RESULTS AND DISCUSSIONS

The analytical results from soil and groundwater samples collected in May 2013 are summarized in **Table 1 and Table 2,** respectively. Conestoga-Rovers and Associates (CRA) performed a data quality assessment and validation for laboratory reports generated for this investigation. CRA concluded that data included in the reports are valid for the intended purpose. Validation forms for the soil and groundwater data are included with the laboratory analytical reports in **Appendices I and J,** respectively.

3.1 Soil Analytical Data

PID readings ranged from 1.8 to 50.1 parts per million (ppm) in soils from monitoring well MW-1, MW-2 and MW-3. In MW-4, PID readings ranged from 70 to 375 ppm; the highest of which was detected at 14 feet bgs, near the depth of the first encountered water.

DRO was detected above the laboratory reporting limit (LRL) in four of the nine soil samples collected. All detections were below the San Francisco Regional Water Quality Control Board's 2013 Tier 1 Environmental Screening Level (ESL) of 100 milligrams per kilogram (mg/kg) with the exception of a detection of 290 mg/kg in the soil sample collected at 10.5 feet bgs in MW-4. In the same soil sample, detections of MORO and various PAH

were reported above the LRL. However, all detections were below their respective Tiers 1 ESLs. Minor concentrations of various PAHs were also detected in the soil sample collected at 5.0 feet bgs in MW-3. See **Table 1** for a summary of detections and their respective screening levels.

3.2 Groundwater Data

Using the gauging data collected on May 29, 2013, Antea Group calculated the groundwater elevation in each well from surveyed well casings. **Figure 5** shows groundwater flow direction to the west-northwest at a shallow gradient of 0.031 feet per foot (ft/ft). In historic reports, groundwater elevation contours prepared with the sites former well network showed somewhat variable localized flow patterns across the site with an overall flow toward the west-southwest, which is more directly toward Santa Rosa Creek. Depth to groundwater ranged from 9.90 feet bgs (MW-4) to 14.03 feet bgs (MW-1) feet below ground surface.

Groundwater samples from all wells were below laboratory reporting limits for all analytes. Groundwater analytical data, depth to water measurements, and well casing and groundwater elevations are listed on **Table 2.**

5.0 CONCLUSIONS AND RECOMMENDATIONS

- Antea Group abandoned two monitoring wells (SRMW-07 and SRMW-08) in February and May 2013 to facilitate SMART's site improvement activities, and per NCRWQCB request. These wells were screened across both the shallow and deeper water-bearing zones and last sampled by EBA in 2008. During that 2008 sampling event, all analytes were below screening levels in SRMW-07. Well SRMW-08 was located near the eastern property boundary, upgradient from onsite source areas, and contained methyl tertiary butyl ether (MTBE) above the ESL. MTBE is a not a chemical associated with the site.
- Blaine Tech collected groundwater samples from the monitoring wells on May 29, 2013. No analytes were detected above the LRLs.
- Antea Group installed four monitoring wells (MW-1 through MW-4) in May 2013 and collected soil samples during their installation. The highest detections in soil from MW-4 at 10.5 feet bgs; only the DRO detection was above its ESL. The depth of the detections in MW-4 coincides with the top of the saturated zone observed during the subsequent groundwater sampling event (9.90 feet bgs). The more elevated groundwater impacts previously observed along the property boundary in 2012 (perimeter borings B-1 though B-4) may be attributed to previous operations on the adjacent property west of the site. This notion was discussed in further detail in our *Site Remedial Action and Investigation Report* dated October 16, 2012, and is further supported by the lower detections in soil and groundwater obtained during the current investigation.
- Since the case reopened, the 2008 Soil and Groundwater Management Plan was submitted by EBA (and approved by the RWQCB) to manage known soil and groundwater impacts that may be encountered during site development/improvement activities. Additionally, the USTs discovered in 2008 were removed in 2011 with approximately 210 tons of impacted soil from the former UST pit. Further, in 2012,

approximately 758 tons of secondary source material was removed to address impacts in the vicinity of former boring SB1 as requested by the RWQCB. The site's soil and groundwater concentrations are comparable to the known conditions at the time of the site's 2007 case closure. Therefore, Antea Group recommends three additional quarterly groundwater sampling events to evaluate the stability of groundwater conditions over one hydrologic cycle. If conditions remain stable, Antea Group will request that the NCRWQCB consider the site for environmental case closure.

6.0 WASTE DISPOSAL

Soil cuttings, construction debris, and wastewater generated during well destruction, well installation, well development and well sampling were placed in Department of Transportation (DOT) approved 55-gallon drums, sealed and labeled in accordance with DOT protocols for non-hazardous waste. The drums were temporarily stored on-site pending waste profiling, then transported by United Pumping, Inc. and disposed of at a licensed facility. The executed non-hazardous waste manifests are included in **Appendix K.**

7.0 REMARKS

The findings contained in this document represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. For any reports cited that were not generated by Antea USA, Inc., the data from those reports are used "as is" and is assumed to be accurate. Antea USA, Inc does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. This document is based upon a specific scope of work requested by the client. Agency Correspondence

From: Goebel, Janice@Waterboards
To: Lia Holden
Cc: Matt Villaber (Matt.Villaber@sonoma-county.org)
Subject: RE: Southern Pacific Site, Third Street, Santa Rosa: Abandonment February 15
Date: Tuesday, February 12, 2013 11:29:19 AM

Lia,

Thanks for the update on the well abandonment and for your quick response to properly abandon the well. As we have discussed, our office is in agreement with well abandonment due to the circumstances with development of the site. If you need any assistance with this project, please let me know.

Regards,

Janice

To: Goebel, Janice@Waterboards
Cc: matt.villaber@sonoma-county.org; James E. Diel
Subject: RE: Southern Pacific Site, Third Street, Santa Rosa: Abandonment February 15

Please note…abandonment is for THIS **Friday, February 15**, not February 22.

Thanks again!

Hi Janice,
Per our telephone conversations, and your verbal approval, we plan to conduct an "emergency" abandonment of well SRMW-08 this Friday, February 15. This is an upgradient well, in the path of site development activities that were schedule to occur this week. Matt at Sonoma County Environmental Health has kindly agreed to expedite the abandonment permit. Their office is closed today, but I will complete the well abandonment work plan and permit application today for his processing tomorrow. SMART has agreed to pay for the well abandonment permit.

Janice and Matt, I greatly appreciate your assistance and in working with us on such short notice.

Thank you!

Lia

CALIFORNIA Water Boards

EDMUND G. BROWN JR. GOVERNOR

MATTHEW RODRIQUEZ SECRETARY FOR ENVIRONMENTAL PROTECTION

North Coast Regional Water Quality Control Board

February 26, 2013

Mr. Jim Diehl
Union Pacific Railroad Company
9451 Atkinson Street, Suite 100
Roseville, CA 95747
JEDiel@up.com

Dear Mr. Diehl:

Subject: Comments on Site Remedial Action and Investigation Report

File: Southern Pacific Transportation Company, 3rd Street Property, Santa Rosa, California, Case No 1NSR196

On October 18, 2012, Regional Water Board staff received the *Site Remedial Action and Investigation Report*, prepared by Antea Group for the former Southern Pacific Third Street property. Antea Group documents work conducted at the site including the data from removal of an underground storage tank, and soil and groundwater sampling data on the southwest side of the property. In addition, four groundwater monitoring wells are proposed to be drilled at the site.

The soil and groundwater sampling data shows Motor Oil Range Organics (MORO) and Diesel Range Organics (DRO) in soil and groundwater samples. The highest levels of MORO and DRO are present in groundwater grab sample locations B1, B2, and B3.

Table 1 of the report lists the soil sampling analytical data, and compares the results to Residential, Commercial and Industrial San Francisco Bay Regional Water Board's Environmental Screening Levels. For Benzo(a)pyrene [B(a)P] the California Human Health Screening Levels is 0.13 mg/kg.

Antea is proposing to install four groundwater monitoring wells at the site. I concur with the installation of the wells as proposed.

Recently, SRMW-08 was abandoned because of construction activities associated with the SMART train depot. In reviewing the construction details of this well, upgradient well SRMW-07 is screened across two water bearing zones. At some point, Monitoring Well SRMW-07 should be destroyed.

A schedule for the installation of the wells and report of the well installation is requested by March 22, 2013.

If you have any questions, please contact me at (707) 576-2676 or at Janice.goebel@waterboards.ca.gov

Sincerely,

Original Signed By

Janice M. Goebel

EDMUND G. BROWN JR. GOVERNOR

MATTHEW RODRIQUEZ SECRETARY FOR ENVIRONMENTAL PROTECTION

North Coast Regional Water Quality Control Board

June 11, 2013

Mr. James Diehl
Union Pacific Railroad Company
9451 Atkinson Street, Suite 100
Roseville, CA 95747

Dear Mr. Diehl:

Subject: Comments on Well Abandonment Work Plan

File: Southern Pacific Transportation Company, 20 West Third Street, Santa Rosa
Case No 1NSR196

On May 1, 2013, Regional Water Board staff received the Well Abandonment Work Plan, prepared by Antea Group, for the former Southern Pacific railroad property located on West Third Street in Santa Rosa. Antea Group is proposing to overdrill groundwater monitoring well SRMW-07. We concur with the destruction of SRMW-07 as proposed.

If you have any questions, please contact me at (707) 576-2676 or at Janice.Goebel@waterboards.ca.gov.

Sincerely,

Original signed by

Janice M. Goebel
Sanitary Engineering Associate

Appendix B

Previous Investigations and Site History Summary

PREVIOUS INVESTIGATION AND SITE HISTORY SUMMARY

Over the history of environmental activities at the site, laboratories and consultants have used a wide variety of terms for petroleum hydrocarbons reported in analysis of soil and water. Soil and groundwater samples are analyzed typically by Environmental Protection Agency (EPA) method 8015B or 8260B. Antea®Group (Antea Group) uses the designation GRO for total petroleum hydrocarbons as gasoline within the C_5 to C_{10} carbon range, DRO for total petroleum hydrocarbons as diesel within the C_{10} to C_{28} carbon range, and RRO for total petroleum hydrocarbons as residual range organics (oil) within the C_{24} to C_{40} carbon range.

Terms from previous reports may include total recoverable petroleum hydrocarbons (TRPH), total purgeable petroleum hydrocarbons (TPPH) for GRO, total extractable petroleum hydrocarbons (TEPH) for DRO, and total volatile hydrocarbon (TVH) which refers to a broad carbon range. More specific historical terms are total petroleum hydrocarbons as gasoline (TPHg or TPH-G), total petroleum hydrocarbons as diesel (TPHd or TPH-D), and total petroleum hydrocarbons as oil or motor oil (TPHo, TPHmo, TPH-O, or TPH-MO). The designations are generally comparable to GRO, DRO, and RRO. Antea Group has left the original designation when summarizing historic data and the current designations when applied to recent investigations and summary discussions.

SITE HISTORY

In December 1987, Canonie Environmental Services Corporation (Canonie) removed three USTs from the site. These included a 230-gallon fuel oil UST, a 10,000-gallon diesel UST, and a 10,000-gallon gasoline UST, which were located within and northwest of the existing fenced enclosure. During UST removal activities, no holes or signs of leakage or overfilling were noted for any of the tanks. TPH were not detected above laboratory reporting limits in the soil samples collected from beneath the USTs (Industrial Compliance [IC], 1992).

In April 1990, the North Coast Regional Water Quality Control Board (RWQCB) drilled four borings in the western portion of the property and installed monitoring wells in two of the borings (MW-2 and MW-3). Monitoring well MW-3 was located approximately 100 feet down gradient (to the southwest) of the former fuel oil UST. Based on information presented in a July 1992 report by IC, analytical results for samples collected from the RWQCB borings showed that no petroleum hydrocarbons were present in soil samples collected from soil boring B-1. However, oil and grease was present in the soil sample collected from boring B-1 at 12 feet below ground surface (bgs) at a concentration of 200 milligrams per kilogram (mg/kg). Additionally, this sample contained low concentrations of polynuclear aromatic hydrocarbons (PAHs). Soil samples collected at depths of 6 and 16 feet bgs from soil boring MW-3 contained petroleum hydrocarbons quantified as diesel (TPHd) at concentrations of 11 and 30 mg/kg, respectively. No petroleum hydrocarbons were detected in the groundwater sample collected by the RWQCB from monitoring well MW-2; TPHd was detected at a concentration of 0.4 milligrams per liter (mg/l) in the groundwater sample collected at monitoring well MW-3 (Geomatrix Consultants, Inc. [Geomatrix], 2000).

Soil and grab groundwater samples were collected from five borings located near the former UST area by IC in 1992. No detectable concentrations of petroleum hydrocarbons, benzene, toluene, ethylbenzene, or xylenes

(BTEX compounds), or PAHs were reported in any of the soil samples collected. Grab groundwater samples collected from the location of the former diesel and gasoline USTs did not contain petroleum hydrocarbons or BTEX above laboratory reporting limits. The grab groundwater sample collected from the former fuel oil tank location reportedly contained TPHd at concentrations of 31 mg/l; no gasoline or BTEX compounds were detected in the grab groundwater sample collected from IC-B6 (Geomatrix, 2000).

The RWQCB destroyed monitoring wells MW-2 and MW-3 in June 1995. In November 1996, Geomatrix performed an investigation of soil and groundwater at the site to evaluate potential significant environmental impacts resulting from historical features or features identified during previous investigations and to respond to a request by the RWQCB to perform additional characterization in the vicinity of the former underground fuel oil tank. Twelve borings (SRB20 through SRB31) were drilled and samples were analyzed for TPHd, total petroleum hydrocarbons quantified as motor oil (TPHmo), PAHs, metals, and volatile organic compounds (VOCs). Soil samples collected for analyses of TPHd, PAHs, and metals were composited vertically from each boring; discrete samples subsequently were analyzed if elevated concentrations of constituents were detected. Only discrete samples were analyzed for VOCs. Petroleum hydrocarbons were detected in soil at elevated concentrations in boring SRB20 and SRB21, however the presence of petroleum hydrocarbons at these locations decreased with depth. Specifically, the shallower composite sample from SRB20 contained TPHmo at a concentration of 900 mg/kg. Discrete samples from depths of 4.0 and 6.5 feet contained TPHmo at concentrations of 69 mg/kg and less than 5 mg/kg, respectively. No TPHd was detected in soil samples from boring SRB20. In SRB21, TPHmo was present at a concentration of 510 mg/kg in the shallow composite sample; no TPHmo was detected in deeper, discrete samples from this boring. Shallow composite and deeper discrete soil samples from boring SRB21 contained TPHd, at a maximum concentration of 1,600 mg/kg. The concentration of TPHd in this boring decreased with depth and was not detected in the sample collected from 13.5 feet bgs (Geomatrix, 2000).

PAHs were detected in soil at concentrations below 1996 EPA screening criteria for industrial exposure. Concentrations of PAHs detected at this time are also below current PRGs (USEPA, 1999). For example, the maximum detected concentration of benzo(a)pyrene was 0.026 mg/kg in the discrete sample collected from a depth of 12.5 feet bgs in boring SRB22; the current PRG for benzo(a)pyrene is 0.29 mg/kg. The highest PAH concentration detected was in the discrete soil sample collected from a depth of 7 feet bgs in boring SRB22. In this sample, flourene was detected at a concentration of 0.87 mg/kg; the PRG for flourene is 33,000 mg/kg. Metals concentrations in soil were within expected background concentrations and less than 10 times the soluble threshold limit concentration (STLC)4 in all of the soil samples (discrete and composite). Concentrations of metals in soil samples also were below industrial PRGs. No TPHd, TPHmo, or VOCs were detected in groundwater above laboratory reporting limits. The results of the 1996 sampling program indicated no significant environmental issues at the site. However, based on its review of the results of the November 1996 work, the RWQCB requested that additional issues be addressed before case closure would be considered. These items, which are the focus of the work described herein, include additional evaluation of historical features, potential leachability of petroleum hydrocarbons, and groundwater quality at various site locations (Geomatrix, 2000).

In September 2001, five on-site and off-site groundwater monitoring wells were installed to characterize impacts to groundwater at the project site. A majority of wells were installed in the area of the aforementioned Santa Rosa Woolen Mills facility in the northwest portion of the project site. An up-gradient, single-screen monitoring well was installed on the eastern portion of the property in vicinity of the main line railroad tracks.

Extensive investigative activities were performed in 2002 on the northwest area of the project site at the historical location of the Santa Rosa Woolen Mills Facility. Soil samples collected as part of an investigation within this area reported significant concentrations of petroleum hydrocarbons present in soil and groundwater in the area of the fueling structures, the area of the former above ground fuel storage tank (AST), and the location of a former UST. Impacts to soil were identified as being primarily heavy range petroleum hydrocarbons. From June 2002 to November 2002, an additional characterization was performed in the northwestern area and a fenced enclosure at the property. Soil samples collected from these areas indicated significant concentrations of diesel and motor oil in soil. Proposed remedial options included excavation and removal of accessible impacted soil (EBA, 2008b).

In October and November 2003, approximately 6,500 cubic yards of impacted soil were removed from several areas of the project site. The most significant remediation efforts targeted the northwestern portion of the project site where several areas were excavated to remove impacted soil. Source removal activities began in the area of a former wooden UST that is indicated on historic Sanborn maps for the Santa Rosa Woolen Mills facility. During the excavation activities, remnants of the former UST were found and removed, whereupon the excavation was advanced to a total depth of approximately 18 feet bgs. A significant amount of free-phase petroleum hydrocarbon product was encountered on the groundwater surface during the excavation activities. The product and water was subsequently pumped, treated, and disposed of to the sanitary sewer. The excavation in this area, which resulted in the removal of approximately 700 cubic yards of impacted materials, proceeded to within 20 feet of the existing Sixth Street Warehouse and was subsequently terminated due to concerns of structure stability. Confirmation soil samples indicated that impacted materials containing significant concentrations of diesel and motor oil remained in place in the excavation sidewalls and groundwater in this area (EBA, 2008b).

Excavation activities in the northwestern portion of the property also included the removal off a fuel pipeline. The associated trench was enlarged as it encountered impacted materials in an area designated as the main pit excavation area. A total of 350 cubic yards of impacted materials were removed from this area. The excavation pit extended to depths below first encountered groundwater, which was encountered at approximately 19 feet bgs. The maximum depth attained by the excavation was approximately 22 feet bgs. Impacted groundwater encountered within the excavation pit, which included free-phase petroleum hydrocarbon product, was subsequently removed using pumps, treated, and disposed of to the sanitary sewer (EBA, 2008b).

Additional excavation was also performed on the south side of the aforementioned product line trench in the northwestern area. Approximately 325 cubic yards of impacted soil was removed from this area. Approximately 270 cubic yards of impacted soil was excavated and removed in the southwestern side of the project site identified as the “southern warehouse area” (EBA, 2008b).

Quarterly groundwater monitoring performed in the northwestern portion of the project site property and west into the neighboring property parcel indicated low levels of petroleum hydrocarbons in a monitoring well identified as SRMW-13 located in the northwest corner of the property. In addition, the fuel oxygenate methyl tert-butyl ether (MTBE) was detected in SRMW-8 located on the northeast side of the property. The remaining monitoring wells appear to have been relatively free of impacts during the time monitored (EBA, 2008b).

The RWQCB issued a *No Further Action* (NFA) letter for the previous case at the site on August 31, 2007. In 2008, Sonoma Marin Area Rail Transit District (SMART) granted an option to purchase the site, formerly owned by Northwestern Pacific Railroad Authority (NWRPA) to New Railroad Square Associates, LLC for transit-oriented development purposes. In anticipation of property ownership for the site, New Railroad Square Associates, LLC (with consent from SMART) contracted the services of EBA Engineering (EBA) to perform environmental assessment activities. EBA's November 2008 *Comprehensive Report on Findings* concluded that on-site hazardous materials presently exist at various locations on the property. These materials include an underground oil storage tank (UST), heavy hydrocarbon soil and groundwater impacts in the vicinity of soil boring SB-1, and impacted shallow soil across the site. The RWQCB reopened the environmental case for the site on January 16, 2009 based on EBA's findings.

In a letter dated February 4, 2011, the RWQCB directed UPRR to remove the oil UST on the property. In November 2011, United Pumping Services (UPS) removed the UST as directed. However, during the initial day-lighting activities of the oil UST, an additional 500-gallon UST containing oil was discovered adjacent and west of the known tank. UPS evacuated, cleaned, and removed the second UST in conjunction with the known UST. UPS excavated and disposed of approximately 213.03 tons of impacted soil surrounding the USTs, and pumped approximately 500 gallons of oil impacted groundwater from the excavation. Antea Group collected 16 soil samples and one grab groundwater sample from within the excavation. Based on the distribution of MORO, DRO, VOCs, and PAHs, it appears that a release from the removed USTs only affected the immediate soils surrounding the USTs. Sidewall samples NWB and SWB collected at 15 feet bgs reported concentrations of VOCs and PAHs not found in any other (shallower) samples collected. From the available data, soil VOCs and PAHs impacts appear to be the result of impacted groundwater within the capillary fringe, originating from outside of the excavated area, and not due to a release from the USTs at that location.

In a directive letter dated January 19, 2012, the RWQCB requested removal of soil in the area of SB-1 prior to SMART's planned land development activities. In addition to the soil excavation, the RWQCB also requested an investigation of the extent of groundwater impacts, including the presence of separate hydrocarbons at the former UST area, groundwater impacts in the area of SB-1, and requested that UPRR clarify the relationship of on-site discharges and off-site impacts to the west beneath adjacent properties. In April 2013, Antea Group advanced borings B1 through B8 at the site. Data from these borings indicated the highest soil concentrations along the southwestern property boundary. Analyte concentrations in groundwater exceeding environmental screening

levels (ESLs) were on the southern-most portion of the southwestern property boundary (borings B1 and B2). The qualitative UVOST/CPT data from B-6 through B-8 (surrounding the former UST pit) showed that the only boring displaying potential hydrocarbon impacts around the former UST area was boring B7 in the interval of approximately 5 to 10 feet bgs. None of the groundwater samples collected from borings surrounding the former UST area contained concentrations above the ESLs.

In July 2012, Antea Group oversaw the removal of secondary source soils in the vicinity of SB-1. Soils were excavated as previously proposed by EBA in their *Soil Excavation work plan*, dated October 2009. Significant source removal occurred during excavation activities as indicated by visual observation of soils removed as well as waste composite hydrocarbon concentrations. Sidewall and base sample analytical results from the excavation show that only those soil samples from the southwest portion of the excavation exceeded commercial/industrial ESLs for DRO and MORO.

In an email dated February 12, 2013, the RWQCB approved the urgent abandonment of monitoring well SRMW-08 to facilitate SMART onsite construction activities planned that same week. Structures were planned to be constructed in the location of the well. The monitoring well was subsequently abandoned on February 15, 2013.

In a letter dated February 26, 2013, the RWQCB directed Antea Group to complete groundwater impact investigation activities, which included the installation sampling of groundwater monitoring wells, initially requested in their February 2012 directive letter and proposed in Antea Group's *Site Remedial Action and Investigation Report dated October 16, 2012*. In their letter, the RWQCB also approved the abandonment of monitoring well SRMW-07. In May 2013, SRMW-07 was abandoned and four monitoring wells (MW-1 through MW-4) were installed, surveyed, developed, and sampled.

SENSISTIVE RECEPTORS

Geomatrix performed a well survey in 2000. Domestic and industrial water supply for the site vicinity is provided through the City of Santa Rosa, which purchases water from the Sonoma County Water Agency (SCWA). The SCWA delivers water to the City via the Sonoma County aqueduct. The source of the water is the Russian River, which is fed by three main upstream reservoirs. The City of Santa Rosa also has eight standby wells to pump groundwater for emergency purposes; these wells currently are not in use (Geomatrix, 2003).

Information provided by the City of Santa Rosa Utilities Department (SRUD) indicates that 50 groundwater wells are located within a half mile of the site. Of these wells, 21 are located within a half mile generally to the north (hydraulically up- and cross-gradient of the site) and 29 are located within a half mile generally to the south (hydraulically down-gradient of the site). Of the 50 wells, only four are located within a one-quarter mile radius, with two wells located approximately up gradient and two approximately down gradient. Based on conversations with SRUD personnel, only two of the residences located within one-half mile from the site are not connected to the City of Santa Rosa water supply. These residences are located at 654 and 658 Dutton Avenue. Uses for the

wells are not tracked by SRUD in all cases, but records indicate that the wells within one-quarter mile of the site are used for irrigation and external use (Geomatrix, 2003).

Information about the possible presence of an additional water producing well located near the site was provided by the RWQCB. This well was not included in the SRUD database. The well is located to the west of the site between the site and Santa Rosa Creek; its actual location has not been field-verified. At this time the well is not in use, and based on a conversation with the site redeveloper, the well will not be used in the future and will be appropriately destroyed (Geomatrix, 2003).

Permit # _____

I hereby agree to comply with all laws and regulations of the County of Sonoma and State of California pertaining to water well construction. I will telephone (707) 565-6565, 48 hours in advance, to notify the Environmental Health Specialist when completing or destroying a well. I will furnish the Director of Health Services and the owner a legible copy of the State Water Well Driller's Report within 15 days; and a copy of the Summary Report, including sample results, should be received by this Department within 90 days in order to obtain final approval on this well permit. I acknowledge that the application will become a permit ***only*** after site approval and payment of fee. I understand that this permit is not transferable and expires one year from date of issuance.

_____ Date 4/18/13

Signature of Well Driller—***no proxies***

Insurance Carrier Acord AICW0104110C Expiration Date 8/31/13

Once all wells/borings are installed, submit a Well Driller's Log and/or Summary Report to complete permit process.

Indicate on attached plot plan the exact location of well(s) with respect to the following items: property lines, water bodies or water courses drainage pattern, roads, existing wells, sewer main and laterals and private sewage disposal systems or other sources of contamination or pollution. INCLUDE DIMENSIONS. The validity of this permit depends upon the accuracy of the information provided by the applicant.

Appendix D

Antea Group's Standard Operating Procedures

Standard Operating Procedures

Borehole Advancement using Hollow Stem Auger

Pre-cleaned hollow stem augers (typically 8 to 10 inches in diameter) are advanced using a drill rig. A pre-cleaned split spoon sampler is lined with three 6-inch long brass or stainless steel tubes and attached to the drill rods. The sampler is then driven 18 inches into the underlying soils at the target sample interval by repeatedly dropping a 140-pound hammer over a 30-inch free fall distance. The number of blow counts to drive the sampler each 6-inch interval of sampler advancement are recorded on the field logs. The sampler is driven 18 inches or until the sampler has met refusal (typically 50 blows per six inches), then the sampler is retrieved. Alternatively, soil samples are retrieved by driving the sampler using a pneumatic hammer, when using a limited access rig.

Generally the bottom sample tube is selected for laboratory analysis. The middle tube is extruded for logging and PID screening, and the top tube is considered slough caved off from the sides of the boring prior to sampling.

The retained sample is carefully packaged for chemical analysis by capping each end of the sample with a Teflon sheet followed by a tight-fitting plastic cap and stored in a zip-type plastic bag. A label is affixed to the sample indicating the sample identification number, borehole number, sampling depth, sample collection date, and job number. The sample is then annotated on a chain-of-custody form and placed in an ice-filled cooler for transport to the laboratory.

During the drilling process, a physical description of the encountered soil characteristics (i.e. moisture content, consistency or density, odor, color, and plasticity), drilling difficulty, and soil type as a function of depth are described on boring logs. The soil cuttings are classified in accordance with the USCS.

Well Construction (typical)

Selected borings will be converted to groundwater monitoring wells by the installation of Schedule 40 polyvinyl chloride well casing with factory slotted well screen as stated in the body of the work plan. A filter pack of will be placed in the annular space of the monitoring well borings, extending from the bottom of each well casing to approximately 2-feet above the top of the screened casing. A sanitary seal consisting of a 2-foot bentonite will be placed on above the filter sand and charged with water to create a seal. Neat cement grout, mixed at a ratio of 6 gallons of water per 94 pounds of Portland cement, is introduced via a tremie pipe to displace standing water in the well annulus bentonite to within two feet of the ground surface. Antea Group will install a minimum of a 5-foot annual seal. A traffic-rated well box will be installed on each well to protect and finish the well to surface grade.

The groundwater monitoring wells will be allowed to stabilize for a minimum of 72 hours after installation prior to development. Following development, the wells will be allowed stabilize for a minimum of 48 hours prior to the collection of any groundwater samples.

Organic Vapor Procedures

Soil samples are collected for analysis in the field for ionizable organic compounds using a photo-ionization detector (PID) with a 10.2 eV lamp. The test procedure involves measuring approximately 30 grams from an undisturbed soil sample, placing this sub-sample in a jar covered with aluminum foil. The container is warmed for approximately 20 minutes in the sun; then the head-space within the container is tested for total organic vapor, measured in parts per million as benzene

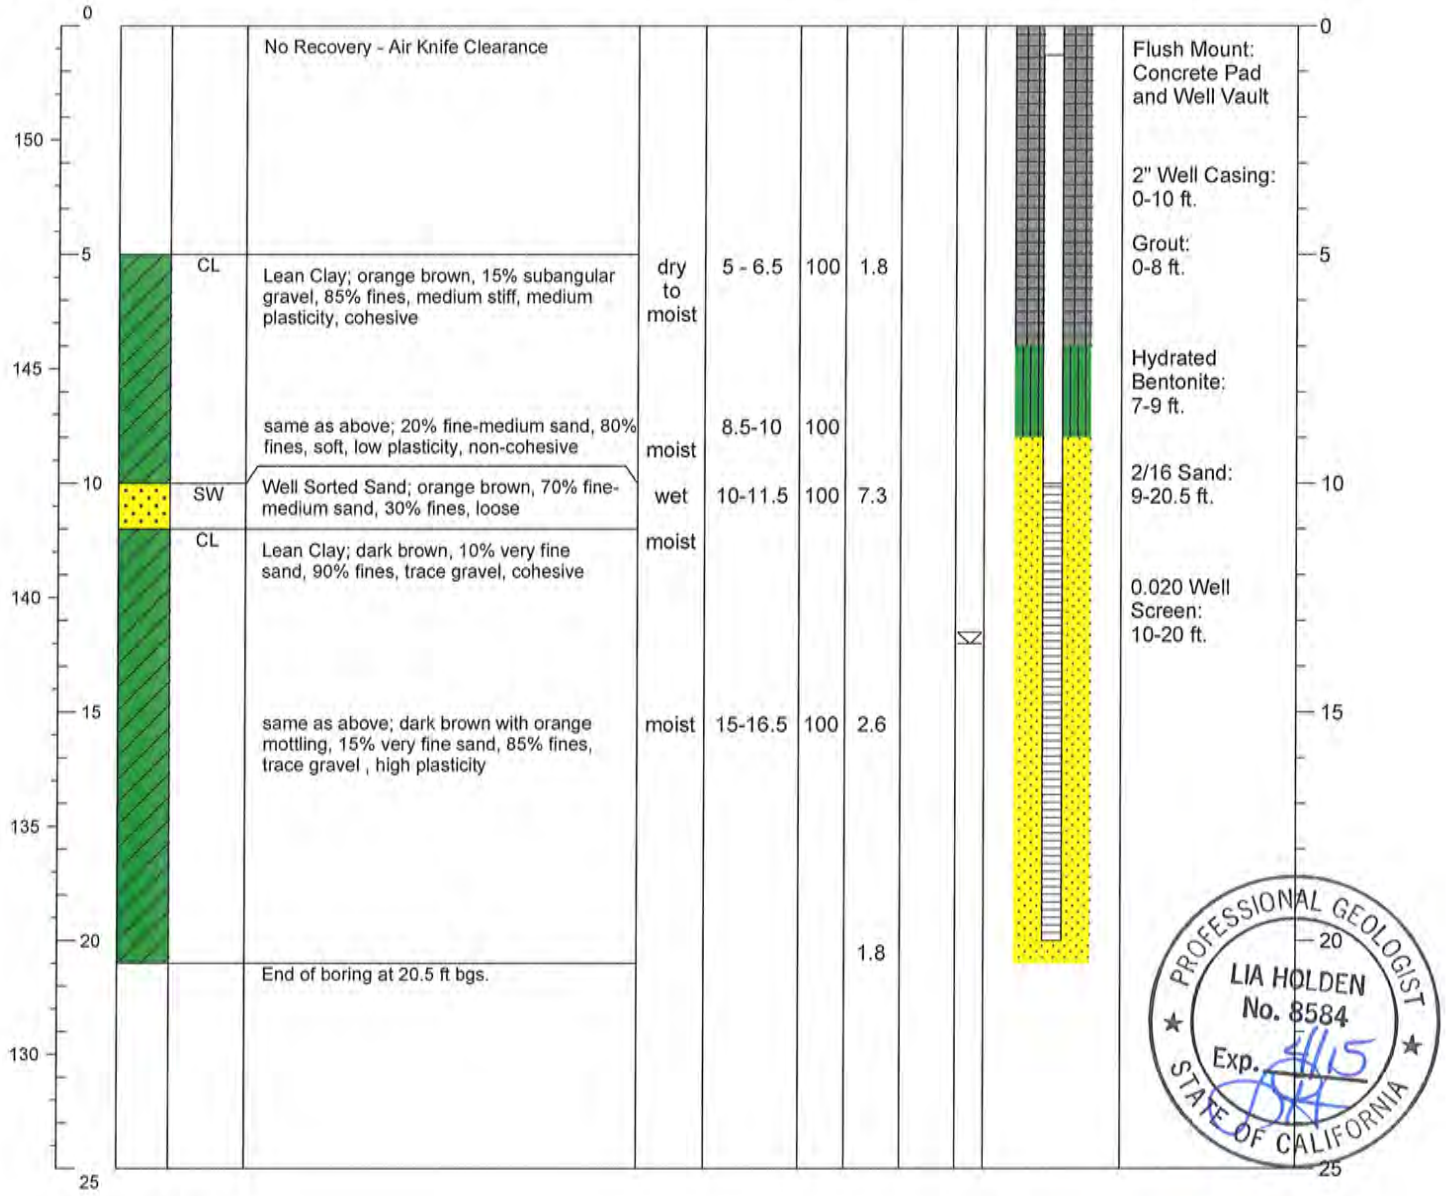
(ppm; volume/volume). The instrument is calibrated prior to drilling. The results of the field-testing are noted on the boring logs. PID readings are useful as a qualitative indication of relative levels of contamination, but cannot be used to quantify petroleum hydrocarbon concentrations with the confidence of laboratory analyses.

Equipment Decontamination

Equipment that could potentially come in contact subsurface media and compromise the integrity of the samples is carefully decontaminated prior to drilling and sampling. Drilling auger and other large pieces of equipment are decontaminated using high pressure hot water spray. Soil and groundwater sampling apparatus, groundwater pumps, liners and other equipment are decontaminated in an Alconox scrub solution and double rinsed in clean tap water rinse followed by a final distilled water rinse.

The rinsate and other wastewater are contained in 55-gallon DOT-approved drums, labeled (to identify the contents, generation date and project) and stored on-site pending waste profiling and disposal.

Waste Handling and Disposal *(Soil Cuttings and Rinsate/Purge Water)*



Soil cuttings and rinsate/purge water generated during drilling and sampling are stored on-site in DOT-approved 55-gallon steel drums pending characterization. A label is affixed to the drums indicating the contents of the drum, suspected contaminants, date of generation, and the boring number from which the waste is generated. The drums are removed from the site by a licensed waste disposal contractor to an appropriate facility for treatment/recycling.

SPH or Purge Water Drum Log

Client: Antea

Site Address: UPRR @ Santa Rosa, CA

STATUS OF DRUM(S) UPON ARRIVAL						
Date	5/20/13					
Number of drum(s) empty:	—					
Number of drum(s) 1/4 full:	—					
Number of drum(s) 1/2 full:	—					
Number of drum(s) 3/4 full:	—					
Number of drum(s) full:	8					
Total drum(s) on site:	8					
Are the drum(s) properly labeled?	Yes					
Drum ID & Contents:	soil cuttings H2O					
If any drum(s) are partially or totally filled, what is the first use date:	5/16/13					

- If you add any SPH to an empty or partially filled drum, drum must have at least 20 gals. of Purgewater or DI Water.

-If drum contains SPH, the drum MUST be steel AND labeled with the appropriate label.

-All BTS drums MUST be labeled appropriately.

STATUS OF DRUM(S) UPON DEPARTURE						
Date	5/21/13					
Number of drums empty:	—					
Number of drum(s) 1/4 full:	—					
Number of drum(s) 1/2 full:	—					
Number of drum(s) 3/4 full:	—					
Number of drum(s) full:	10					
Total drum(s) on site:	10					
Are the drum(s) properly labeled?	Yes					
Drum ID & Contents:	soil Purge H2O					

LOCATION OF DRUM(S)
Describe location of drum(s): Next to MW-3

FINAL STATUS						
Number of new drum(s) left on site this event	2					
Date of inspection:	5/21/13					
Drum(s) labelled properly:	Yes					
Logged by BTS Field Tech:						
Office reviewed by:

SPH or Purge Water Drum Log

Client: Antea

Site Address: UPRR @ Santa Rosa, CA

STATUS OF DRUM(S) UPON ARRIVAL						
Date	5/20/13	5/20/13				
Number of drum(s) empty:	—					
Number of drum(s) 1/4 full:	—					
Number of drum(s) 1/2 full:	—					
Number of drum(s) 3/4 full:	—	1				
Number of drum(s) full:	8	9				
Total drum(s) on site:	8	10				
Are the drum(s) properly labeled?	Yes	Yes				
Drum ID & Contents:	soil cuttings H2O	soil H2O				
If any drum(s) are partially or totally filled, what is the first use date:	5/16/13	5/16/13				

- If you add any SPH to an empty or partially filled drum, drum must have at least 20 gals. of Purgewater or DI Water.

-If drum contains SPH, the drum MUST be steel AND labeled with the appropriate label.

-All BTS drums MUST be labeled appropriately.

STATUS OF DRUM(S) UPON DEPARTURE						
Date	5/21/13	5/21/13				
Number of drums empty:	—					
Number of drum(s) 1/4 full:	—					
Number of drum(s) 1/2 full:	—					
Number of drum(s) 3/4 full:	—					
Number of drum(s) full:	10	10				
Total drum(s) on site:	10	10				
Are the drum(s) properly labeled?	Yes	Yes				
Drum ID & Contents:	soil Purge H2O	soil purge H2O				

LOCATION OF DRUM(S)	
Describe location of drum(s):	Next to MW-3

FINAL STATUS						
Number of new drum(s) left on site this event	2	0				
Date of inspection:	5/21/13	5/21/13				
Drum(s) labelled properly:	Yes	Yes				
Logged by BTS Field Tech:						
Office reviewed by:

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
D	Surrogate or matrix spike recoveries were not obtained because the extract was diluted for analysis; also compounds analyzed at a dilution may be flagged with a D.
X	Surrogate is outside control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Comments
No additional comments.

Receipt
The samples were received on 5/17/2013 5:45 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.8º C.

GC/MS Semi VOA
Method 8270C SIM: The following sample was diluted due to the abundance of non-target analytes: SO-2344-MW4-10.5-11.0-160513 (720-49803-9). Elevated reporting limits (RLs) are provided.

No other analytical or quality issues were noted.

GC Semi VOA
Method 8015B: Due to the level of dilution required for the following sample, surrogate recoveries are not reported: SO-2344-MW4-10.5-11.0-160513 (720-49803-9).

No other analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

RE: Data Quality Assessment and Validation of Report J49803
Monitoring Well Installation
Union Pacific Railroad (UPRR)
2 Fourth Street and 34 Sixth Street
Santa Rosa, California
May 2013

INTRODUCTION

The following document details a reduced validation of analytical data resulting from the May 2013, collection of soil samples in Santa Rosa, California. Samples were submitted to Test America Laboratories (TA), located in Pleasanton, California. A sample collection and analysis summary is presented in Table 1. A summary of the analytical methodology is presented in Table 2. The validated analytical results are summarized in Table 3.

Standard Conestoga-Rovers & Associates (CRA) report deliverables were submitted by the laboratory. The final results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the chain of custody form, finished report forms, method blank data, recovery data from surrogate spikes, laboratory control samples (LCS) and matrix spikes.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 2 and the document entitled:

i) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", United States Environmental Protection Agency (USEPA) 540/R-99-008, October 1999

These guidelines are collectively referred to as "Guidelines" in this Memorandum.

SAMPLE HOLDING TIME AND PRESERVATION

The sample holding time criteria and sample preservation requirements for the analyses are summarized in Table 2. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

EQUAL EMPLOYMENT OPPORTUNITY EMPLOYER

REGISTERED COMPANY FOR ISO 9001 ENGINEERING DESIGN

All samples were properly delivered on ice, stored by the laboratory at the required temperature (<6°C).

LABORATORY METHOD BLANK ANALYSES

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures.

For this study, laboratory method blanks were analyzed at a minimum frequency of one per 20 investigative samples and/or one per analytical batch.

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation.

SURROGATE SPIKE RECOVERIES

In accordance with the methods employed, all samples, blanks and QC samples analyzed for semi-volatile organic compounds (SVOCs) and diesel range organics/oil range organics (DRO/ORO) are spiked with the appropriate number of surrogate compounds prior to sample extraction. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of semi-volatile organic compound (SVOC) analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. All surrogate recoveries met the above criteria.

LABORATORY CONTROL SAMPLE (LCS) ANALYSES

LCS and/or laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS/LCSD were analyzed at a minimum frequency of one per 20 investigative samples and/or one per analytical batch.

Organic Analyses

The LCS/LCSD contained all compounds of interest. All LCS recoveries and relative percent differences were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) ANALYSES

To evaluate the effects of sample matrices on the extraction or digestion process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as MS/MSD samples. The RPD between the MS and MSD is used to assess analytical precision.

MS/MSD analyses were performed as specified in Table 1.

Organic Analyses

The MS/MSD samples were spiked with all compounds of interest. All percent recoveries and RPD values were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision.

ANALYTE REPORTING

The laboratory did not report any detected concentrations below the laboratory's practical quantitation limit (PQL)/report limit (RL).

All soil results were reported on a wet weight basis.

CONCLUSION

Based on this assessment of the information provided, the data produced by TA were found to exhibit acceptable levels of accuracy and precision and may be used without qualification.

Qualifiers

GC/MS Semi VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
*	LCS or LCSD exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Narrative

Job Narrative
720-50010-1

Comments
No additional comments.

Receipt
The samples were received on 5/30/2013 5:15 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 1.2º C and 1.9º C.

GC/MS Semi VOA
Method 8270C SIM: The laboratory control sample (LCS) and / or the laboratory control sample duplicate (LCSD) for batch #137648 recovered outside control limits for the following analytes: fluoranthene, fluorene.

No other analytical or quality issues were noted.

GC Semi VOA
No analytical or quality issues were noted.

Organic Prep
No analytical or quality issues were noted.

Detection Summary

Client: Antea USA, Inc.
Project/Site: UPRR- Santa Rosa

TestAmerica Job ID: 720-50010-1

Client Sample ID: W-2344-MW-1-290513 — **Lab Sample ID: 720-50010-1**

No Detections.

Client Sample ID: W-2344-MW-2-290513 — **Lab Sample ID: 720-50010-2**

No Detections.

Client Sample ID: W-2344-MW-3-290513 — **Lab Sample ID: 720-50010-3**

No Detections.

Client Sample ID: W-2344-MW-4-290513 — **Lab Sample ID: 720-50010-4**

No Detections.

This Detection Summary does not include radiochemical test results.

RE: Data Quality Assessment and Validation of Report J50010
Site Assessment
Union Pacific Railroad (UPRR)
2 Fourth Street and 34 Sixth Street
Santa Rosa, California
May 2013

INTRODUCTION

The following document details a reduced validation of analytical data resulting from the May 2013, collection of groundwater samples in Santa Rosa, California. Samples were submitted to Test America Laboratories (TA), located in Pleasanton, California. A sample collection and analysis summary is presented in Table 1. A summary of the analytical methodology is presented in Table 2. The validated analytical results are summarized in Table 3.

Standard Conestoga-Rovers & Associates (CRA) report deliverables were submitted by the laboratory. The final results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the chain of custody form, finished report forms, method blank data, recovery data from surrogate spikes and laboratory control samples (LCS).

The QA/QC criteria by which these data have been assessed are outlined in the analytical method referenced in Table 2 and the document entitled:

i) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review", United States Environmental Protection Agency (USEPA) 540/R-99-008, October 1999

These guidelines are collectively referred to as "Guidelines" in this Memorandum.

SAMPLE HOLDING TIME AND PRESERVATION

The sample holding time criteria and sample preservation requirements for the analyses are summarized in Table 2. Sample chain of custody documents and analytical reports were used to determine sample holding times. All samples were prepared and analyzed within the required holding times with the exceptions of a

few semi-volatile organic compounds (SVOCs) extracted outside of the method specified hold time. The associated sample results were qualified as estimated (See Table 4).

All samples were properly preserved and delivered on ice, stored by the laboratory at the required temperature (<6°C).

LABORATORY METHOD BLANK ANALYSES

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures.

For this study, laboratory method blanks were analyzed at a minimum frequency of one per 20 investigative samples and/or one per analytical batch.

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation.

SURROGATE SPIKE RECOVERIES

In accordance with the methods employed, all samples, blanks and QC samples analyzed for SVOCs and diesel range organics/motor oil range organics (DRO/ORO) are spiked with the appropriate number of surrogate compounds prior to sample extraction. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

Each individual surrogate compound is expected to meet the laboratory control limits with the exception of SVOC analyses. According to the "Guidelines" for SVOC analyses, up to one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against laboratory control limits. All surrogate recoveries met the above criteria.

LABORATORY CONTROL SAMPLE (LCS) ANALYSES

LCS and/or laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS/LCSD were analyzed at a minimum frequency of one per 20 investigative samples and/or one per analytical batch.

Organic Analyses

The LCS/LCSD contained all compounds of interest. All LCS recoveries and relative percent differences were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision with the exceptions of a few low SVOC recoveries. No sample results were associated with the low recoveries.

ANALYTE REPORTING

The laboratory did not report any detected concentrations below the laboratory's practical quantitation limit (PQL)/report limit (RL).

CONCLUSION

Based on this assessment of the information provided, the data produced by TA were found to exhibit acceptable levels of accuracy and precision and may be used with the qualifications noted.

Well Abandonment Work Plan

Union Pacific Railroad
2 Fourth Street and 34 Sixth Street, Santa Rosa, California
North Coast Regional Water Quality Control Board
Case No. 1TSR196

1.0 INTRODUCTION

On behalf of Union Pacific Railroad (UPRR), Antea®Group has prepared this *Well Abandonment Work Plan* to outline proposed abandonment procedures for the proper destruction of wells MW-1 through MW-4, located at the above referenced site (**Figure 1**). In a letter dated December 2, 2014, the North Coast Regional Water Quality Control Board (NCRWQCB) approved destruction of all site wells at the above-reference site (**Appendix A**). The wells are being destroyed as part of the site's case closure process.

2.0 SITE LOCATION AND DESCRIPTION

Currently, the majority of the site is used as an equipment and supply storage area for Sonoma Marin Area Rail Transit (SMART) during offsite construction activities. Additionally, onsite construction activities are occurring in the northern portion of the property. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03. (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties identified as the "3 West Third Street and 60 West Sixth Street Warehouses", to the north by West Sixth Street, and on the east by the main line railroad track right-of-way and commercial properties. A site location map is provided as **Figure 1** and a site plan is provided as **Figure 2**.

3.0 WELL ABANDONMENT ACTIVITIES

3.1 Pre-field Activities

Prior to initiating field activities, Antea Group will obtain necessary well destruction permits from the Sonoma County Department of Health Services, Environmental Services Division. A licensed drilling contractor with a valid State of California C-57 license will conduct the well destruction activities. Antea Group will make notifications at least 72 hours prior to the commencement of field activities.

Antea Group will contact Underground Service Alert (USA) and UPRR's Fiber Optic Hotline to mark the site for subsurface utilities. Antea Group will also contact a private utility locator to assist in the locating of potential underground utilities in the vicinity of the drilling area.

Antea Group will ensure that the Health and Safety Plan (HASP) is updated for the current field tasks and prepared in accordance with Title 8, Section 5192 of the California Code of Regulations. The HASP will contain a list of emergency contacts, potential contaminants, personal protective equipment requirements, and a hospital route map to the nearest emergency facility. The HASP will be reviewed daily by field personnel.

3.2 Groundwater Monitoring Well Abandonments

Four (4) onsite groundwater monitoring wells (MW-1, MW-2, MW-3, and MW-4) will be destroyed by drilling out the wells to their total constructed depth of 18.5 feet below ground surface (bgs; for wells MW-3 and MW-4) and 20 feet bgs (MW-1 and MW-2) (**Table 1**). Drilling will be conducted by a licensed C-57 contractor. Prior to drilling, an air knife (vacuum) rig will clear the upper five feet of soil surrounding the well to expose potentially unmarked utilities and prevent utility damage during auger advancement. The well casing, filter pack, and backfill materials will be removed by advancing eight-inch diameter hollow-stem augers to the total constructed well depths (**Table 1**). After removing the well casing and annular material, the boreholes will be backfilled with neat cement grout through a tremie pipe to just below ground surface, then capped with concrete at the surface. Boring logs are included as **Appendix B**.

3.3 Disposal of Investigation Derived Waste

Soil cuttings, construction debris, and wastewater generated during well destruction activities will be placed in Department of Transportation (DOT) approved 55-gallon drums, sealed and labeled in accordance with the corresponding DOT protocols for non-hazardous waste. The drums will be temporarily stored on-site pending waste profiling, then transported by United Pumping, Inc. and disposed of at a licensed facility. Final non-hazardous waste manifests will be submitted with the well destruction report following completion of field activities.

4.0 SCHEDULE/REPORTING

Well abandonment activities are scheduled to occur following regulatory approval of this work plan. Antea Group anticipates that well destruction activities will take approximately three (3) days. A summary letter/report documenting well abandonment activities will be issued upon receipt of the final executed waste manifests, estimated to be received within 45 days of the completion of field activities.

The activities outlined in this work plan and the preparation of the corresponding report will be conducted under the direction of a licensed California Professional Geologist. In accordance with the California State Water Resources Control Board requirements, the well abandonment report and site plan (showing wells as destroyed) will be uploaded to the GeoTracker database under both of the site's GeoTracker identification numbers.

5.0 LIMITATIONS

The findings contained in this report represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. For any reports cited that were not generated by Antea USA, Inc., the data from those reports are used "as is" and is assumed to be accurate. Antea USA, Inc. does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. This report is based upon a specific scope of work requested by the client. The Contract between Antea Group and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this report were performed. This report is intended only for the use of Antea Group's Client and anyone else specifically listed on this report. Antea Group will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea Group makes no express or implied warranty as to the contents of this report.

Regulatory Correspondence

December 2, 2014

Ms. Lauren A. Mancuso
Manager of Environmental Site Remediation
Union Pacific Railroad Company
9451 Atkinson Street, Suite 100
Roseville, CA 95747

Dear Ms. Mancuso:

Subject: End of Public Comment Period, Request for Monitoring Well Destruction Workplan

File: Southern Pacific Transportation Company, 20 West Third Street, Santa Rosa Case No. 1TSR196 and 1NSR196

On November 24, 2014, the public comment period ended for consideration of no further action status on the former Southern Pacific Transportation Company site located at 20 West Third Street in Santa Rosa. No comments on the proposed closure were received during the public comment period.

Accordingly, a workplan proposing the destruction of the groundwater monitoring wells is requested by December 31, 2014.

If you have questions, please contact me at Janice.Goebel@waterboards.ca.gov or at (707) 576-2676.

Sincerely,

Janice M. Goebel
Sanitary Engineering Associate

Gentlemen:

Subject: Case Status
File: Southern Pacific Transportation Company, 3rd Street Property, Santa Rosa, Case No. 1TSR196

On January 16, 2009, we concurred with the EBA Engineering recommendations to remove the underground oil storage tank under permit from the Santa Rosa Fire Department, prepare a work plan to address the soil and groundwater impacts in the vicinity of SB-1A, and prepare a soil and groundwater management plan to address the shallow soil impacts prior to and during property development.

At that time, we indicated that:

- The underground storage tank needed to be removed as soon as possible;
- The work plan to address the soil and groundwater impacts in the vicinity of SB-1 was due within 60 days of issuance of the January 16, 2009 letter; and
- The soil and groundwater management plan needed to be submitted prior to property development.

As of this date, the underground tank has not been removed and the work plan has not been submitted. Therefore, on April 24, 2009, I inquired with the Santa Rosa Fire Department regarding the status of the underground storage tank and learned that an application has not been filed for tank closure.

Title 23, Article 7 regulates underground storage tank closure and requires the permanent closure of underground storage tanks in which the storage of hazardous substances has ceased. By copy of this letter, I am referring the issue of tank closure at this site to the Santa Rosa Fire Department as the permitting and enforcement agency for compliance with Title 23, Article 7, Section 2672(b).

The underground storage tank must be removed as soon as possible. A revised compliance date for the submittal of the work plan is 45-days from issuance of this letter. If you have any questions I can be reached at (707) 576-2675.

Sincerely,

Joan Fleck

Gentlemen:

Subject: Underground Oil Storage Tank Removal
File: Southern Pacific Transportation Company, 3rd Street Property, Santa Rosa, Case No. 1TSR196

On January 16, 2009, we concurred with the EBA Engineering recommendations to remove the underground oil storage tank under permit from the Santa Rosa Fire Department; prepare a work plan to address the soil and groundwater impacts in the vicinity of SB-1A; and prepare a soil and groundwater management plan to address the shallow soil impacts prior to and during property development. On May 27, 2009, a follow up letter was sent reiterating the required action items for this site.

The *Soil and Groundwater Management Plan* prepared by EBA Engineering on behalf of the Railroad Square Associates LLC was submitted on August 10, 2009. The *Soil Excavation Work Plan*, also prepared by EBA Engineering on behalf of the Railroad Square Associates LLC, was submitted on October 14, 2009. However, as of this date, the underground tank has not been removed.

Title 23, Article 7 regulates underground storage tank closure and requires the permanent closure of underground storage tanks in which the storage of hazardous substances has ceased. The tank needs to be removed. The Santa Rosa Fire Department is the lead agency for tank closure activities. Ms. Corey Vincent with Santa Rosa Fire can be reached at (707) 543-3542.

If you have any questions I can be reached at (707) 576-2675.

Sincerely,

Gentlemen:

Subject: Case Status
File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, Case No. 1TSR196

On January 16, 2009, the Southern Pacific Transportation Company case was reopened as a result of new discoveries reported in the November 2008 ***Report of Findings Sonoma-Marin Area Rail Transit Property*** and the January 7, 2009 ***Additional Information*** document prepared by EBA Engineering on behalf of Railroad Square Associates, LLC. The discoveries included an underground oil storage tank (UST), heavy hydrocarbon soil and groundwater impacts in the vicinity of soil boring SB-1, and shallow soil impacts.

Following receipt of this information, Regional Water Board staff requested that Union Pacific Railroad (UPR) and Sonoma Marin Area Rail Transit (SMART) remove the UST and submit two plans; a soil groundwater management plan to address shallow soil impacts and a work plan to address soil and groundwater impacts in the SB-1 area. The Railroad Square Associates LLC responded with the submittal of the ***Soil and Groundwater Management Plan*** and the ***Soil Excavation Work Plan*** on August 10, 2009 and October 14, 2009, respectively. For the record, Railroad Square Associates LLC is not a responsible party.

Subsequent written requests regarding tank removal were directed to UPR and SMART on May 27, 2009 and October 30, 2009. As of this date, efforts to remove the tank under permit from the Santa Rosa Fire Department have not been made.

This matter was discussed during the January 20, 2011 meeting held at the Carlile-Macy office in Santa Rosa including the relationship of land development

and completion of the environmental work. In summary, completion of the environmental work is critical for these reasons:

- Underground storage tank removal and excavation work plan implementation are required by law and regulation;
- Land development at the former railroad yard is dependent on the completion of the environmental work; and
- Some of the heavy hydrocarbon groundwater impacts beneath land to the west are likely the result of on site migration. Therefore, source removal work at the site is essential for water quality protection and to provide information regarding sources of groundwater impacts beneath other properties.

Two years have passed since the January 2009 letter, which is a generous amount of time to allow Union Pacific and SMART to resolve their legal interpretations regarding environmental liability issues. However, as I explained during our recent meeting, when progress is not made within a reasonable time frame, a compliance schedule must be established by the regulatory agencies. Proposed land development elevates the priority of a case.

Therefore, within 30-days of issuance of this letter, a written commitment and schedule is needed regarding your plans for tank removal and excavation work plan implementation. For your information, on January 31, 2011, I made another referral to Santa Rosa Fire Department to the attention of Mr. Mark McCormick (Interim Fire Chief) for enforcement of tank closure regulations.

I look forward to receipt of your written commitment and schedule followed by the timely removal of the underground storage tank. If you have any questions or would like to meet again to discuss this case, I can be reached at (707) 576-2675 and Jfleck@waterboards.ca.gov.

Sincerely,

July 22, 2011

Sonoma Marin Area Rail Transit
c/o Mr. John Nemeth
750 Lindaro Street, Suite 200
San Rafael, CA 94901

Dear Mr. Nemeth:

Subject: Clarification of Regional Water Board staff letter of February 4, 2011
File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, Case No. 1TSR196

This letter serves as a written follow up of our July 13, 2011 phone conversation regarding the Regional Water Board staff letter dated February 4, 2011. In response to your request for clarification regarding the remaining work to be completed at the 3rd Street Property, I offer the following information:

Remaining work to be completed includes the:

1. Removal of the oil underground storage tank under permit from the Santa Rosa Fire Department.

   If evidence of a discharge is revealed at the time of tank removal, contaminated soil must be removed from this area and depending upon the degree of the discharge, the impact to water quality may need to be investigated and remediated. As stated in the February 4, 2011 letter, heavy hydrocarbon impacts to groundwater exist on and off site to the west and the tank may be a contributing source.

2. Removal of known shallow contaminated soil impacts.
3. Removal of shallow contaminated soil impacts encountered during property development.
4. Proper management of soil and groundwater during property development.

   A plan has been submitted to address these items, which is the August 2009 ***Soil and Groundwater Management Plan*** (SGMP) prepared by EBA Engineering on behalf of Railroad Square Associates LLC, who is not a responsible party.

Implementation of the soil and groundwater management plan will be a condition of property development and grading permit issuance. Implementation of the plan by someone other than EBA will require the identification of the licensed professional who will be in responsible charge of the project. Responsible parties may also submit their own SGMP.

5. Removal of impacted soil contamination in the area of B-1.

   Evidence of a surface discharge in the area of B-1 was reported in the November 2008 ***Report of Findings*** prepared by EBA Engineering. A plan has been submitted for the excavation of impacted soil in this area, which is the October 2009 ***Soil Excavation Work Plan*** prepared by EBA Engineering on behalf of the Railroad Square Associates LLC.

   The proposed scope of work must be implemented as soon as possible and prior to property development. Implementation of the plan by someone other than EBA will require the identification of the licensed professional who will be in responsible charge of the project. Responsible parties may also submit their own soil excavation work plan.

   Ground water impacts exist in the area of B-1. The extent will need to be defined and the impacts remediated.

If you have any questions or require further clarification, I can be reached at (707) 576-2675 and Jfleck@waterboards.ca.gov.

Sincerely,

Gentlemen:

Subject: Case Status

File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, Case Nos. 1TSR196 and 1NSR196

In the Regional Water Board staff letter dated July 22, 2011, remaining items to be completed were identified, which included the removal of the oil underground storage tank; removal of known shallow soil impacts; and removal of impacted soil in the vicinity of SB-1. It was stated that if evidence of a discharge is revealed at the time of tank removal, contaminated soil must be removed and depending upon the degree of discharge, the impact to water quality may need to be investigated. The purpose of this letter is to bring this file up to date summarizing work conducted since July 2011 and reiterating work items that remain to be completed.

Underground Storage Tanks

On November 3, 2011, the underground oil storage tank was removed. At the time of removal, a second tank was discovered and removed along with visually impacted soil. The excavation was continued to groundwater where separate phase oil product was observed.

Based on recent communications with Antea Group staff working on behalf of Union Pacific Railroad, report preparation is in progress and submittal is anticipated in the next few weeks.

.

Shallow Soil Impacts

As previously stated, shallow soil impacts may be addressed prior to and/or during property development.

Soil Removal at SB-1

Soil removal in the area of SB-1 must be completed as soon as possible and prior to land development activities. The work may be conducted according to the existing work plan prepared by EBA Engineering submitted on behalf of the Railroad Square Associates, LLC (who is not a responsible party) or a new work plan. If someone other than EBA Engineering implements the existing work plan, the licensed professional in responsible charge of the project must be identified.

Based on the current development plans, a delay in completing remedial actions in the area of SB-1 may impact the installation of proposed infrastructure.

Extent of Groundwater Impacts

In addition to the soil removal project at SB-1, a work plan must be submitted to investigate the extent of groundwater impacts including the presence of separate phase oil at the former tank location, groundwater impacts in the area of SB-1, and clarify the relationship of on-site discharges and off-site impacts to the west beneath adjacent properties. The work plan is due within 45-days of issuance of this letter.

If you have any questions or would like to meet to discuss this case, I can be reached at (707) 576-2675 and Jfleck@waterboards.ca.gov.

Sincerely,

Gentlemen:

Subject: UST Removal Report and Site Assessment Work Plan

File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, Case Nos. 1TSR196 and 1NSR196

Regional Water Board staff (staff) reviewed the January 24, 2012 *UST Removal Report* and the February 29, 2012 *Site Assessment Work Plan* prepared by Antea™Group for the former rail yard in Santa Rosa. Staff has no comments on the *UST Removal Report*. The *Site Assessment Work Plan* was discussed with Antea™Group staff on March 15, 2012. The discussions included:

- The excavation of impacted soil in the vicinity of SB-1 (as proposed in the EBA Engineering *Soil Excavation Work Plan* dated October 2009) is acceptable. The excavation depth is to groundwater and groundwater/separate phase hydrocarbon removal from the open excavation is planned.
- The drilling of qualitative borings using the CPT-UVOST technology is acceptable. However, the extent of dissolved phase hydrocarbons must also be defined. Staff request that grab groundwater samples also be collected for chemical analysis.
- The drilling of the exploratory soil borings on the southwestern boundary is acceptable.

By copy of this letter, Santa Rosa Fire and Sonoma County Environmental Health have been informed of our concurrence to enable the processing of the excavation and drilling permits, respectively. Due to competing interests at this property and the need to coordinate efforts, an expedited work plan implementation schedule is highly encouraged.

If you have any questions, I can be reached at (707) 576-2675 and Jfleck@waterboards.ca.gov.

Sincerely,

JEDiel@up.com

Dear Mr. Diel:

Subject: **Request for Cost Reimbursement**

File: Southern Pacific Transportation Company
3rd Street Property
Santa Rosa, California
Case No 1NSR196

The California Water Code (Porter-Cologne Water Quality Control Act), Section 13304, allows the Regional Water Board to recover reasonable expenses from a responsible party for overseeing cleanup of unpermitted discharges, contaminated properties, and other unregulated releases adversely affecting the water of the State. Historic property uses have resulted in soil and groundwater contamination. Discharges from the above-referenced site threaten to affect the State's water, specifically site groundwater. The beneficial uses of areal groundwater include domestic water supply, agricultural supply, and industrial supply.

Further monitoring, investigation, and cleanup are required, and it is our intent to recover costs for the regulatory oversight. The oversight work includes site inspections, coordination with other agencies, sampling, meetings, case discussions and review of technical reports, workplans, and other related materials. Also, in compliance with AB2507, our agency is obligated to inform you every year of the following information regarding our recovery of oversight costs:

1. A detailed estimate of the work to be performed or services to be provided;
2. A statement of the expected outcome of that work;

3. The billing rates of all individuals and classes or employees expected to engage in the work; and
4. An estimate of all expected charges to be billed to you by this agency.

ESTIMATE OF WORK TO BE PERFORMED:

Regional Water Board staff estimate that the following work will be performed during fiscal year 2012/2013 on the Southern Pacific Transportation Company, 3rd Street site:

- Evaluate the site status to assess compliance with Regional Water Board requirements and California Water Code;
- Review monitoring reports;
- Review interim remedial action implementation plan;
- Review of reports, and any needed plans to complete investigation of the vertical and horizontal extent of groundwater contamination;
- Meet with and provide written correspondence and telephone communication with representatives of the Union Pacific Railroad Company, Sonoma Marin Area Rail Transit, Santa Rosa Fire Department, and other responsible third parties;
- Conduct internal communications (i.e., meetings, memos, etc.) regarding the project;
- Encourage public involvement in remediation issues at critical points; and
- Conduct site inspections.

STATEMENT OF EXPECTED OUTCOME

- Confirm appropriate groundwater monitoring parameters;
- Written comments on workplans and reports;
- Comply with public participation and other needs of the California Environmental Quality Act (CEQA);
- Identify and fill data gaps as needed to develop a final remedial action plan;
- Ensure compliance with the California Environmental Quality Act;
- Ensure consistency with the California Water Code, regulations, and policies;
- Continue evaluation of threats to water quality from site contaminants;
- Verify adequacy of reports and plans; and
- Prepare meeting summaries, telephone conversation summaries, etc. to document the file record and site progress.

BILLING RATES

Enclosure 1 is a description of the billing process and Enclosure 2 is a summary of the billing rates for employees expected to perform the work. The names and

classifications of employees that charge time to this site will be listed on the invoices. The average billing rate is about $150 per hour.

ESTIMATION OF EXPECTED CHARGES

Regional Water Board staff expects to charge about 60 hours of work related to this site during fiscal year 2012/2013 (July 1, 2012 through June 30, 2013). Based on the average billing rate of $150 per hour, the estimate billing charge for this site during fiscal year 2012/2013 is about $9,000.

Please sign and return to our agency the enclosed acknowledgement form (Enclosure 3) to our Agency by August 15, 2012.

If you have any questions, please contact me at (707) 576-2676 or by e-mail at jgoebel@waterboards.ca.gov.

Sincerely,

ACKNOWLEDGEMENT OF RECEIPT OF
CLEANUP AND ABATEMENT COST RECOVERY LETTER

I, _____, acknowledge that I have received and read a copy of the enclosed REIMBURSEMENT PROCESS FOR REGULATORY OVERSIGHT and the cover letter dated **August 10, 2012** concerning cost reimbursement for Regional Water Board staff costs involved with oversight of cleanup and abatement efforts at **Southern Pacific, 3rd Street Property** located at 2 Fourth Street and 34 Sixth Street in Santa Rosa, Sonoma County, California.

I understand the reimbursement process and billing procedures as explained in the letter. I am willing to participate in the cost recovery program and pay all subsequent billings in accordance with the terms in your letter and its enclosures. I also understand that signing this form does not constitute any admission of liability, but rather only an intent to pay for costs associated with regulatory oversight activities. Billings for payment of oversight costs should be mailed to the following:

Case No. 1NSR196
120810_JMG_UP3rdstreet_CR

August 10, 2012

Mr. Jim Diel
Union Pacific Railroad Company
9451 Atkinson Street, Suite 100
Roseville, CA 95747
JEDiel@up.com

Dear Mr. Diel:

Subject: Project Update and Request for Report/Workplan

File: Southern Pacific Transportation Company
3rd Street Property, Santa Rosa, California
Case No 1NSR196

On July 11, 2012, I inspected the excavation at the former Union Pacific 3rd Street property with the Santa Rosa Fire Department. Prior to the inspection, I reviewed the Site Assessment Work Plan dated February 29, 2012, prepared by Anteagroup. The Work Plan states that soil and groundwater samples will be collected, but not analyzed for volatile organic compounds (VOCs) and semivolatile organic compounds (SVOCs).

Review of the analytical data generated for the site indicates VOCs and SVOCs are present in soil and groundwater at the site. Future soil and groundwater sampling shall include these constituents of concern in the sampling program.

The Work Plan also stated on Page 5, Section 2.3.3 Monitoring Well Installations, that four groundwater monitoring wells will be installed. However, the timing for installation is stated as contingent upon site redevelopment activities. The schedule for well installation is considered vague, and a workplan proposing the locations of the monitoring wells and schedule for installation is needed.

This site has soil and groundwater contamination from underground storage tanks release(s), and from other spills and discharges not associated with underground storage tanks. The majority of the site contamination is related to spills and discharges.

Therefore, reports generated as part of the site investigation and cleanup should be uploaded to Geotracker under the Case No. 1NSR196.

Accordingly, pursuant to Section 13267(b) of the California Water Code, the report of the excavation and boring program, including the monitoring well installation workplan and schedule is requested by September 7, 2012.

If you have any questions, please contact me at (707) 576-2676 or via e-mail at Janice.Goebel@waterboards.ca.gov.

EDMUND G. BROWN JR. GOVERNOR

MATTHEW RODRIQUEZ SECRETARY FOR ENVIRONMENTAL PROTECTION

North Coast Regional Water Quality Control Board

February 26, 2013

Mr. Jim Diehl
Union Pacific Railroad Company
9451 Atkinson Street, Suite 100
Roseville, CA 95747
JEDiel@up.com

Dear Mr. Diehl:

Subject: Comments on Site Remedial Action and Investigation Report

File: Southern Pacific Transportation Company, 3rd Street Property, Santa Rosa, California, Case No 1NSR196

On October 18, 2012, Regional Water Board staff received the *Site Remedial Action and Investigation Report*, prepared by Antea Group for the former Southern Pacific Third Street property. Antea Group documents work conducted at the site including the data from removal of an underground storage tank, and soil and groundwater sampling data on the southwest side of the property. In addition, four groundwater monitoring wells are proposed to be drilled at the site.

The soil and groundwater sampling data shows Motor Oil Range Organics (MORO) and Diesel Range Organics (DRO) in soil and groundwater samples. The highest levels of MORO and DRO are present in groundwater grab sample locations B1, B2, and B3.

Table 1 of the report lists the soil sampling analytical data, and compares the results to Residential, Commercial and Industrial San Francisco Bay Regional Water Board's Environmental Screening Levels. For Benzo(a)pyrene [B(a)P] the California Human Health Screening Levels is 0.13 mg/kg.

Antea is proposing to install four groundwater monitoring wells at the site. I concur with the installation of the wells as proposed.

Recently, SRMW-08 was abandoned because of construction activities associated with the SMART train depot. In reviewing the construction details of this well, upgradient well SRMW-07 is screened across two water bearing zones. At some point, Monitoring Well SRMW-07 should be destroyed.

A schedule for the installation of the wells and report of the well installation is requested by March 22, 2013.

If you have any questions, please contact me at (707) 576-2676 or at Janice.goebel@waterboards.ca.gov

Dear Mr. Diehl:

Subject: Comments on Well Abandonment Work Plan

File: Southern Pacific Transportation Company, 20 West Third Street, Santa Rosa
Case No 1NSR196

On May 1, 2013, Regional Water Board staff received the Well Abandonment Work Plan, prepared by Antea Group, for the former Southern Pacific railroad property located on West Third Street in Santa Rosa. Antea Group is proposing to overdrill groundwater monitoring well SRMW-07. We concur with the destruction of SRMW-07 as proposed.

If you have any questions, please contact me at (707) 576-2676 or at Janice.Goebel@waterboards.ca.gov.

Sincerely,

Mr. Jim Diel
Union Pacific Railroad Company
9451 Atkinson Street, Suite 100
Roseville, CA 95747

Dear Mr. Diel:

Subject: **ANNUAL ESTIMATION LETTER**

File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, California
Case No 1NSR196; (201-0122)

The California Water Code (Porter-Cologne), Section 13304, allows the Regional Water Board to recover reasonable expenses from a responsible party for overseeing site investigation and cleanup of unregulated discharges adversely affecting or threatening to affect State's waters. The Regional Water Board intends to continue to recover costs for regulatory oversight work conducted at this site in accordance with our prior correspondence on this matter. In compliance with AB2057, our agency is obligated to inform you every year of the following information regarding our recovery of oversight costs:

1. A detailed estimate of the work to be performed or services to be provided;
2. A statement of the expected outcome of that work;
3. The billing rates of all individuals and classes or employees expected to engage in the work; and
4. An estimate of all expected charges to be billed to you by this agency.

ESTIMATE OF WORK TO BE PERFORMED:

Regional Water Board staff estimate that the following work will be performed during fiscal year 2013/2014 on the former Southern Pacific 3rd Street site:

- Evaluate the site status to assess compliance with Regional Water Board requirements and California Water Code;
- Review monitoring reports;
- Review of reports, and any needed plans to complete investigation of the vertical and horizontal extent of groundwater contamination;
- Review interim remedial action implementation plan;

- Meet with and provide written correspondence and telephone communication with representatives of Union Pacific Railroad Company, and other responsible third parties;
- Conduct internal communications (i.e., meetings, memos, etc.) regarding the project;
- Encourage public involvement in remediation issues at critical points; and
- Conduct site inspections.

STATEMENT OF EXPECTED OUTCOME

- Confirm appropriate groundwater monitoring parameters;
- Written comments on workplans and reports;
- Comply with public participation and other needs of the California Environmental Quality Act (CEQA);
- Identify and fill data gaps as needed to develop a final remedial action plan;
- Ensure compliance with the California Environmental Quality Act;
- Ensure consistency with the California Water Code, regulations, and policies;
- Continue evaluation of threats to water quality from site contaminants;
- Verify adequacy of reports and plans; and
- Prepare meeting summaries, telephone conversation summaries, etc. to document the file record and site progress.

BILLING RATES

Enclosure 1 is a summary of the billing rates for employees expected to perform the work. The names and classifications of employees that charge time to this site will be listed on the invoices. The average billing rate is about $150.00 per hour.

ESTIMATION OF EXPECTED CHARGES

Regional Water Board staff expects to charge about 60 hours of work related to this site during fiscal year 2013/2014 (July 1, 2013 through June 30, 2014). Based on the average billing rate of $150.00 per hour, the estimated billing charge for this site during fiscal year 2013/2014 is about $9,000.

If you have any questions, please call me at (707) 576-2676.

Sincerely,

SUBJECT: Case Evaluation and Recommendation for Case Closure

FILE: Southern Pacific Transportation Company, 20 West Third Street, Santa Rosa, Case No. 1TSR196 and 1NSR196

The site is located at 20 West Third Street in Santa Rosa as shown on Figures 1 and 2. The property has been a railroad freight depot and maintenance/fueling yard from the late 1800's through the 1960's. The site has been vacant and generally unused since the late 1960's. In 2008, the Sonoma Marin Area Rail Transit (SMART) was granted an option to purchase the site. As part of that transaction, an environmental assessment was conducted by SMART that identified additional areas needing investigation, including the removal of an underground storage tank. SMART is currently using this portion of the site for construction storage.

The site has had several soil and groundwater investigations beginning in 1987. An extensive cleanup of the site has also been conducted, and the site was closed for no further action in 2007. On January 16, 2009, the site was reopened based on the findings of two 550 underground storage tanks (USTs), and an area of soil and groundwater contamination near Boring SB-1.

In November of 2011, the USTs were removed and approximately 213 tons of soil excavated and transported off-site for disposal. In addition approximately 500 gallons of oily water from the base of the excavation was removed and transported off-site for disposal. The area near Boring SB-1 was also excavated. Approximately 758 tons of soil was excavated and disposed, and 1,500 gallons of water pumped and properly disposed.

Four groundwater monitoring wells have been installed at the site and sampled five times for diesel range organics (DRO) and motor oil range organics (MORO) with and without silica gel cleanup, and PAHs. No PAHs have been detected in groundwater at the method detection limits. DRO and MORO have been reported below the detection limit to a high of 340 ug/L for DRO and 210 ug/L for MORO without silica gel cleanup. With silica gel

cleanup, DRO and MORO have been detected in a range below the detection limit to 70 µg/L and 110 µg/L, respectively.

In summary, low levels of DRO and MORO have been detected in groundwater in one groundwater monitoring well. The site meets the Low Threat Closure Criteria for groundwater under No 1.5 which states: "The regulatory agency determines, based on an analysis of site specific conditions, that the site under current and reasonably anticipated near-term future scenarios, the contaminant plume poses a low threat to human health and safety and to the environment and water quality objectives will be achieved within a reasonable time frame".

In addition, the site is served by city water, and even though Santa Rosa Creek is 160 feet away from the site, the heavy end hydrocarbons are not migrating. A site located in between the rail yard and Santa Rosa Creek, (the Franchetti site located at 60 West Sixth Street, Santa Rosa) installed groundwater monitoring wells that did not detect petroleum hydrocarbons, and was subsequently closed.

Accordingly, I recommend that the site be noticed for 60 day public comment period proposing no further action at the site.

September 25, 2014

Ms. Lauren A. Mancuso
Manager of Environmental Site Remediation
Union Pacific Railroad Company
9451 Atkinson Street, Suite 100
Roseville, CA 95747

Dear Ms. Mancuso:

Subject: Concurrence with Request for Case Closure, Public Notice Requirements

File: Southern Pacific Transportation Company, 20 West Third Street, Santa Rosa, Case No. 1TSR196 and 1NSR196

On July 30, 2014, Regional Water Board staff received the "Second Quarter 2014 Quarterly Monitoring Report and Case Closure Request", prepared by Anteagroup for the former Southern Pacific Transportation rail yard located at 20 West Third Street in Santa Rosa.

The data from the last groundwater sampling detected low levels of diesel range organics (DRO) and motor oil range organics (MORO) in one groundwater monitoring well. Over 1,000 tons of soil was removed from the former underground storage tank area and the area around SB-1. Approximately 2,000 gallons of groundwater was removed from both excavations and properly disposed. Based on the review of all the data, Regional Water Board staff concurs with the request for closure.

Enclosed is a copy of the public notice proposing that the case be closed and no further action is needed. The public notice period lasts 60 days and solicits comments from interested persons on the proposed "no further action". The public notice will be posted on our web page. Please have the notice circulated to all contiguous landowners and businesses. Proof that the notice has been distributed to all adjacent landowners and business owners needs to be submitted to our office within two weeks of the date of this letter. Please also post a copy of the notice at the site.

If no new or substantial comments are received during the public comment period, you will receive a request for a workplan to destroy all the remaining monitoring wells. Once this has been completed and documentation submitted that all wastes have been removed from the site, you will receive the "no further action" letter.

If you have any questions, please contact me at (707) 576-2676 or via e-mail at Janice.Goebel@waterboards.ca.gov.

Notice of Proposed No Further Action
For
Southern Pacific Transportation Company
20 West Third Street
Santa Rosa, California
Case No. 1TSR196 and 1NSR196
Sonoma County

Notice Posting Date: **September 25, 2014**
Comment Period Ends: **November 24, 2014**

Problem Description
This property has been a railroad freight depot and maintenance/fueling yard from the late 1800's through the 1960's. The site has been vacant and generally unused since the late 1960's. In 2008, the Sonoma Marin Area Rail Transit (SMART) was granted an option to purchase the site. As part of that transaction, an environmental assessment was conducted by SMART that identified additional areas needing investigation, including the removal of underground storage tanks (USTs).

Actions Completed

In November of 2011, two USTs were removed and approximately 213 tons of soil excavated and transported off-site for disposal, and 500 gallons of oily water was pumped from the base of the excavation and transported off-site for disposal. The area near Boring SB-1 was also excavated. Approximately 758 tons of soil was excavated and disposed, and 1,500 gallons of water pumped from the excavation and properly disposed.

Four groundwater monitoring wells have been installed at the site and sampled five times for diesel range organics (DRO) and motor oil range organics (MORO) with the silica gel cleanup, and PAHs. No PAHs have been detected in groundwater at the method detection limits. Low levels of DRO and MORO have been reported in one groundwater monitoring well at the site.

Proposed Action
Unless significant comments are received or new information is presented regarding the site, Regional Water Board staff plans to proceed with the "no further action" determination upon conclusion of the comment period. Please contact Janice Goebel at (707) 576-2676 or e-mail, Janice.Goebel@waterboards.ca.gov for all issues concerning the subject case. Written comments may also be submitted to:

North Coast Regional Water Quality Control Board
Attention: Janice Goebel
5550 Skylane Blvd, Suite A
Santa Rosa, CA 95403

The Regional Water Board records for the site are contained in the file known as Southern Pacific Transportation Company, 20 West Third Street in Santa Rosa, Case No. 1TSR196. The file may be reviewed at the North Coast Regional Water Quality Control Board office from 8:00 am to 5:00 pm Monday through Friday. Appointments are recommended and can be arranged by calling (707) 576-2220. Information on the site can also be found at the State Water Resources Control Board's Geotracker web site at the following link:

Roseville, CA 95747

Dear Ms. Mancuso:

Subject: End of Public Comment Period, Request for Monitoring Well Destruction Workplan

File: Southern Pacific Transportation Company, 20 West Third Street, Santa Rosa Case No. 1TSR196 and 1NSR196

On November 24, 2014, the public comment period ended for consideration of no further action status on the former Southern Pacific Transportation Company site located at 20 West Third Street in Santa Rosa. No comments on the proposed closure were received during the public comment period.

Accordingly, a workplan proposing the destruction of the groundwater monitoring wells is requested by December 31, 2014.

If you have questions, please contact me at Janice.Goebel@waterboards.ca.gov or at (707) 576-2676.

Subject: **Planned Well Installation & Reporting Schedule**
Southern Pacific Transport Company, 3rd Street Property
Santa Rosa, California
CRWQCB – North Coast Region Case Nos. 1TSR196/1NSR196

Dear Ms. Goebel:

In response to your February 26, 2013 correspondence, on behalf of Union Pacific Railroad (UPRR), Antea Group is providing the California Regional Water Quality Control Board – North Coast Region (NCRWQCB) with the planned well installation and reporting schedule. Four groundwater monitoring wells will be installed as proposed in our October 18, 2012 *Site Remedial Action and Investigation Report*. Antea Group will coordinate planned field activities with the property owner [Sonoma Marin Area Rail Transit District (SMART)], obtain permits from Sonoma County Environmental Health, and proceed with the well installation according to the following schedule:

- Well installation field activities will commence on or before **May 30, 2013**.
- Newly installed wells will be properly developed 72 hours following their completion.
- A minimum of 72 hours following development, groundwater samples will be collected from each well.
- Analytical data will be available 14 days following sample submittal to the laboratory.
- Antea Group will prepare and submit a report detailing field activities and analytical results on or before **July 30, 2013**.

If you have any questions please do not hesitate to contact me at the number below.

Sincerely,

Lia N. Holden
Senior Project Manager

Santa Rosa, California
North Coast Regional Water Quality Control Board
Case Nos. 1TSR19 and 1NSR196

1.0 INTRODUCTION

Antea™Group has prepared this Well Abandonment Work Plan to outline proposed abandonment procedures for the proper destruction of well SRMW-07, located at the above referenced site. The North Coast Regional Water Quality Control Board (NCRWQCB) approved the installation of four previously proposed groundwater monitoring wells, and requested the abandonment of well SRMW-07 in their February 26, 2013 directive letter**. (Appendix A).**

2.0 SITE LOCATION AND DESCRIPTION

Currently, the majority of the site is used as a construction equipment and supply storage area for SMART during offsite construction activities. Additionally, onsite construction activities are occurring in the northern portion of the property. The site is composed of two contiguous parcels of land, identified as Sonoma County Assessor Parcel Numbers (APN) 010-171-004 (2 Fourth Street) and 010-166-03 (34 Sixth Street). The site is bounded to the south by Third Street, to the west by former commercial properties (identified as the 3 West Third Street and 60 West Sixth Street Warehouses), to the north by West Sixth Street, and on the east by the main-line railroad track right-of-way and commercial properties. A site location map is provided as **Figure 1**; site features are shown on **Figure 2.**

3.0 PRE-FIELD ACTIVITIES

Prior to initiating field activities, Antea Group will ensure that the Health and Safety Plan (HASP) is updated for the current field tasks and prepared in accordance with Title 8, Section 5192 of the California Code of Regulations. The HASP will contain a list of emergency contacts, potential contaminants, personal protective equipment requirements, and a hospital route map to the nearest emergency facility. The HASP will be reviewed daily by field personnel.

Antea Group will contact Underground Service Alert and UPRR's Fiber Optic Hotline to mark the site for subsurface utilities. Well destruction permits will be obtained from the Sonoma County Department of Health Services, Environmental Health Division. The permit application is included as **Appendix B.**

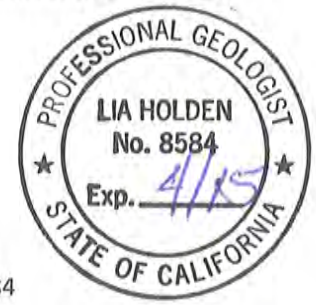
4.0 GROUNDWATER MONITORING WELL ABANDONMENT

One (1) onsite groundwater monitoring wells (SRMW-07) will be destroyed by drilling out the well to its total constructed depth of 22 feet below ground surface (bgs). Drilling will be conducted by a licensed C-57 contractor. Prior to drilling, an air knife (vacuum) rig will clear the upper five feet of soil surrounding the well to expose potentially unmarked utilities and prevent utility damage during auger advancement. The well casing, filter pack, and backfill materials will be removed by advancing eight-inch diameter hollow-stem augers to the total constructed well depth (22 feet bgs). After removing the well casing and annular material, the bore will be backfilled with neat cement grout through a tremie pipe to just below ground surface, then capped with concrete at the surface. The boring log illustrating the well's original construction detail is provided as **Appendix C**.

5.0 DISPOSAL OF INVESTIGATION DERIVED WASTE

Soil cuttings, construction debris, and wastewater generated during well destruction activities will be placed in Department of Transportation (DOT) approved 55-gallon drums, sealed and labeled in accordance with DOT protocols for non-hazardous waste. The drums will be temporarily stored on-site pending waste profiling, then transported by United Pumping, Inc. and disposed of at a licensed facility. Final non-hazardous waste manifests will be submitted with the well destruction report following completion of field activities.

6.0 SCHEDULE/REPORTING



The abandonment of SRMW-07 is scheduled to occur in May 2013, and will be conducted concurrently with the approved well installation activities referenced in the attached agency correspondence (**Appendix A**). A summary report documenting field activities will be issued following receipt of the final executed waste manifests, estimated to be received within 45 days of the completion of field activities.

The activities outlined in this work plan and the preparation of the corresponding report will be conducted under the direction of a licensed California Professional Geologist. In accordance with the California State Water Resources Control Board requirements, the well abandonment report and site plan (showing the well as destroyed) will be uploaded to the GeoTracker database under both of the site's case numbers.

7.0 REMARKS

The findings contained in this document represent Antea Group's professional opinions based upon the currently available information and are arrived at in accordance with currently acceptable professional standards. For any reports cited that were not generated by Antea USA, Inc., the data from those reports are used "as is" and is assumed to be accurate. Antea USA, Inc does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. This document is based upon a specific scope of work requested by the client. The Contract between Antea Group and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this document were performed. This report is intended only for the use of Antea Group's Client and anyone else specifically listed on this report. Antea Group will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea Group makes no express or implied warranty as to the contents of this document.

Agency Correspondence

CALIFORNIA Water Boards

EDMUND G. BROWN JR. GOVERNOR

MATTHEW RODRIQUEZ SECRETARY FOR ENVIRONMENTAL PROTECTION

North Coast Regional Water Quality Control Board

February 26, 2013

Mr. Jim Diehl
Union Pacific Railroad Company
9451 Atkinson Street, Suite 100
Roseville, CA 95747
JEDiel@up.com

Dear Mr. Diehl:

Subject: Comments on Site Remedial Action and Investigation Report

File: Southern Pacific Transportation Company, 3rd Street Property, Santa Rosa, California, Case No 1NSR196

On October 18, 2012, Regional Water Board staff received the *Site Remedial Action and Investigation Report*, prepared by Antea Group for the former Southern Pacific Third Street property. Antea Group documents work conducted at the site including the data from removal of an underground storage tank, and soil and groundwater sampling data on the southwest side of the property. In addition, four groundwater monitoring wells are proposed to be drilled at the site.

The soil and groundwater sampling data shows Motor Oil Range Organics (MORO) and Diesel Range Organics (DRO) in soil and groundwater samples. The highest levels of MORO and DRO are present in groundwater grab sample locations B1, B2, and B3.

Table 1 of the report lists the soil sampling analytical data, and compares the results to Residential, Commercial and Industrial San Francisco Bay Regional Water Board's Environmental Screening Levels. For Benzo(a)pyrene [B(a)P] the California Human Health Screening Levels is 0.13 mg/kg.

Antea is proposing to install four groundwater monitoring wells at the site. I concur with the installation of the wells as proposed.

Recently, SRMW-08 was abandoned because of construction activities associated with the SMART train depot. In reviewing the construction details of this well, upgradient well SRMW-07 is screened across two water bearing zones. At some point, Monitoring Well SRMW-07 should be destroyed.

A schedule for the installation of the wells and report of the well installation is requested by March 22, 2013.

If you have any questions, please contact me at (707) 576-2676 or at Janice.goebel@waterboards.ca.gov

Sincerely,

Subject: Additional Soil Investigation Report
Santa Rosa Station, Southern Property
Santa Rosa, California

Dear Ms. Fleck:

Geomatrix Consultants, Inc. (Geomatrix) has prepared this report to present the results of an additional soil sampling and chemical analysis program conducted at the Santa Rosa Station, Southern Property site. This work was conducted in accordance with the scope of work presented in our April 2000 "Work Plan for Additional Soil Sampling" report. The April 2000 work plan was approved by the California Regional Water Quality Control Board, North Coast Region in a letter, dated July 17, 2000, to Mr. John Moe of Union Pacific Railroad.

Please contact either of the undersigned if you have any questions regarding this report.

Sincerely,
GEOMATRIX CONSULTANTS, INC.

Tony Choi
Project Engineer

At the request of the RWQCB and SRFD, the excavation work plan set a cleanup goal of 65 mg/kg; this objective was developed from "background" lead concentrations at the site. The remediation objective was achieved for average soil concentrations within the two excavations performed at SRB13 and SRB14. Specifically, in the excavation surrounding SRB13, side-wall and bottom confirmation samples contained lead at concentrations of 48, 4.6, 15, 130, 17, and 71 mg/kg; the average concentration of lead in this excavation is 48 mg/kg. In the excavation surrounding SRB14, side wall and bottom confirmation samples contained lead at concentrations of 64, 74, 53, 48, 24 and 30 mg/kg; the average concentration of lead in this excavation is 49 mg/kg. As documented in the excavation implementation report (Geomatrix, 1999b), clean import soil was placed in the excavations and regulatory closure was requested. It should be noted that miscellaneous debris consisting of concrete, wood, and metal was encountered within the SRB14 excavation and that concrete debris was encountered in part of the SRB13 excavation, concentrated in shallow (0.5 to 1.5 feet below ground surface [bgs]) soil in both excavations. The RWQCB in its March 21, 2000 letter, expressed concern that elevated lead concentrations in soil could be related to the presence of debris containing lead, and that the extent of the debris at the site is unknown.

According to documentation provided by the RWQCB, the City of Santa Rosa performed soil and groundwater sampling along the base of the north bank of Santa Rosa Creek. This work was conducted in preparation for the planning and construction of a bicycle/pedestrian path as part of the Prince Memorial Greenway, Creek Restoration Project (PMGP). One soil sample, designated K-24, was collected and analyzed for lead near the base of the creek bed (Figure 2), approximately 50 feet laterally from the site and approximately 22 feet below the creek bank. This sample contained a maximum lead concentration of 389 mg/kg. Based on the result from this one sample, the RWQCB requested that UPRR and the NWPRA explore the possibility of a correlation between the presence of lead at the site and in the creek (RWQCB, 2000).

3.0 SAMPLING AND CHEMICAL ANALYSIS PROGRAM

Four borings were advanced along the southern boundary of the Southern Property (Figure 3) to collect soil samples for chemical analysis. A description of the field sampling and chemical analysis program is presented below.

Prior to commencing fieldwork, a drilling permit was obtained from the Sonoma County Department of Health Services (Appendix A). Underground utilities were identified by notifying Underground Service Alert, a regional subsurface notification center 48 hours prior to

the start of field work and by contracting a private utility locator, Cruz Brothers Subsurface Locators, Inc., of Milpitas, California, to perform a utility clearance at each of the boring locations.

3.1 FIELD METHODS

Geomatrix retained Precision Sampling, Inc. (Precision) of Richmond, California, a state-licensed drilling contractor to advance four borings (SSR30 through SSR33) at the site on August 24, 2000. Each boring was advanced to maximum depths between 25 to 28 feet bgs using a XD-1, direct-push (DP) technology drill rig and the Enviro-Core continuous sampling system.[1] A continuous soil core was collected using a three-foot long continuous core barrel lined with clean butyrate liners. Recovered soil was described and logged by a Geomatrix geologist using the American Society Testing and Material (ASTM) Standard D2488-90 and Munsell color designations (lithologic logs are included as Appendix B), and samples were collected for chemical analyses.

Drilling and sampling equipment was steam cleaned or triple washed with Alconox and distilled water before use at each boring location. During the drilling operation, an organic vapor monitor equipped with a photoionization detector (PID) was used as a screening instrument to evaluate the presence of volatile constituents in the recovered soil samples.

3.1.1 Soil Sampling

Soil samples were collected at approximate two-foot intervals to depths of between 25-feet in borings SSR31 and SSR32 and 28-feet in borings SSR30 and SSR33. The work plan called for analysis of shallow soil samples (collected at approximately 1, 3, 5, and 10 feet bgs) from each boring. The actual field sampling depths are presented on Table 1. Soil samples were collected in $1^{11}/_{16}$-inch by 6-inch butyrate liners sealed at each end with Teflon sheets and closed with plastic end caps and duct tape. All samples were enclosed in plastic bags and stored in an ice-chilled cooler for transport to the analytical laboratory under Geomatrix chain-of-custody procedures.

[1] The Enviro-Core sampling system utilizes a 2.5-inch (outside diameter) steel sample barrel to core soil from borings. If subsurface debris were encountered, depending on the density of the material, the sample barrel would either retrieve debris, advance with no recovery, or would encounter sampling refusal. However, due to the small diameter of EnviroCore sample barrel relative to the area being investigated, other field exploration methods may more effectively evaluate the presence of buried debris.

3.2 ANALYTICAL METHODS

Soil samples were submitted to Entech Analytical Labs, Inc. (Entech), of Sunnyvale, California, and Friedman and Bruya, Inc. (Friedman), of Seattle, Washington, state-certified analytical laboratories, under Geomatrix chain-of-custody procedures. A copy of the laboratory analytical results and the chain-of-custody record is included in Appendix C.

Selected soil samples were analyzed for the following constituents:

- Lead using EPA Method 6010
- Benzene, toluene, ethylbenzene, total xylenes (BTEX), and methyl tert-butyl ether (MTBE) using EPA method 8020. One soil sample was also analyzed using EPA Method 8260 for MTBE

As described in the approved work plan, a sequential sampling methodology was proposed. Soil samples collected from greater than 10 feet bgs would be held by the laboratory pending analytical results for the shallow soil samples. Chemical analysis were actually performed by Entech on the first three and fifth soil samples from each boring (e.g., from SSR30 -1.5, 4.0, 5.5, 10.5 feet bgs). Soil samples collected at depths greater than 4 feet that were analyzed did not demonstrate lead concentrations above "background." Therefore, soil samples collected below depths greater that 11.5 feet that were placed on hold were not analyzed for lead.

At each boring location, odor was encountered between 16 and 23 feet bgs by Geomatrix field personnel. Soil samples near depths associated with relatively higher PID readings were submitted to Friedman and analyzed for BTEX and MTBE. Additionally, these samples were analyzed for total volatile extractable petroleum hydrocarbons (quantified as gasoline, diesel, and motor oil); however, these analyses were performed outside of each sample's holding time. Analytical results for the petroleum hydrocarbon analyses are presented for informational purposes only.

4.0 SITE STRATIGRAPHY

Lithologic observations during drilling of borings SSR30 through SSR33 are generally consistent with observations from previous investigations. The site is generally underlain by aggregate base rock consisting of poorly graded sand with silt and gravel from the ground surface to approximately 1.5 feet bgs. The aggregate base rock is underlain by silt and fine-grained sand [sandy silt and silt with sand (ML)] to depths ranging between 18 and 22 feet bgs.

The thickness of this unit ranged between approximately 16.5 (SSR32) feet to 20.5 feet (SSR30). A clay (CL) unit was encountered in boring SSR33 from 19.5 to 22 feet bgs. Beneath these finder-grained units, a silty sand with gravel (SM) was encountered to the bottom of each boring. No debris was observed at any of the boring locations. Complete lithologic descriptions of subsurface materials encountered during drilling are presented in boring logs presented in Appendix B.

A saturated lens was encountered in each boring at approximate depths ranging from 13.7 to 14.5 feet bgs. The saturated lens was typically approximately 0.4 (SSR33) to 1.5 feet (SSR32) thick. During previous sampling events, groundwater has been encountered at the site at approximate depths of 13 to 14.5 feet bgs.

5.0 LABORATORY ANALYTICAL RESULTS

Soil analytical results are summarized in Table 1. Analytical laboratory data reports are included in Appendix C. The analytical results for soil samples were compared to a site specific background concentration of 65 mg/kg that was agreed upon among the SRFD, RWQCB, UPRR and NWPRA.[2]

5.1 LEAD

Lead was detected above the background concentration in 3 of 16 soil samples. In boring SSR30 at depths of 1.5 and 4.0 feet bgs, lead was detected at concentrations of 140 and 91 mg/kg, respectively. In boring SSR33 at a depth of 2 feet bgs, lead was detected at a concentration of 80 mg/kg. At depths greater than 4 and 2 feet bgs in borings SSR30 and SSR33, respectively, and in borings SSR31 and SSR32 soil lead concentrations were substantially below the "background" concentration of 65 mg/kg.

5.2 PETROLEUM HYDROCARBONS

Four samples, SSR30-22.0, SSR31-23.5, SSR32-21.0, and SSR33-17.5 were analyzed to evaluate the presence of petroleum hydrocarbons. These samples were selected for analyses because they were at or near depths where higher PID readings were recorded.

[2] It should be noted that this concentration is considerably below the residential preliminary remediation goal for lead of 400 mg/kg, established by the United States Environmental Protection Agency, Region 9 (October, 1999). Furthermore, analytical results for deeper soil samples from the previous and current sampling efforts, which contain decreasing lead concentrations demonstrate that lead in shallow soil at the site is insoluble and immobile. Based on this, lead in soil does not appear to pose a threat to human health or groundwater quality.

No petroleum hydrocarbons quantified as gasoline, diesel, or motor oil were detected; however, as previously noted these samples were analyzed outside of holding times. Benzene was detected in two of four samples; ethylbenzene, toluene, and total xylenes were detected in three of four samples. No BTEX or MTBE was detected in boring SSR31. MTBE was detected in sample SSR30-22.0 at a concentration of 0.02 mg/kg (at the reportable limit) using EPA Method 8021. However, after analyzing this sample using EPA Method 8260, which confirms sample results using mass spectrometry, the initial result was shown to be a false positive. MTBE was not detected in the four soil samples.

6.0 DISCUSSION

No debris was observed in the four borings advanced at the site. Analytical results indicate that elevated concentrations of lead relative to "background" (site specific) primarily occur in the upper two feet of soil at two boring locations. The sporadic presence of lead in shallow soil is generally consistent with previous sampling results.

It is unlikely that the source of lead found in Santa Rosa Creek is from the Santa Rosa Station, Southern Section. The concentration of lead detected at sampling location K-24 (389 mg/kg-in Santa Rosa Creek) is approximately two and a half times the average of pre- and post-excavation lead concentrations (145-mg/kg)[3] in the upper two feet of soil at the site. Additionally, the current average of lead concentrations in soil, considering recent soil sampling results (Table 1) in the uppermost two feet of soil overlying the site, is 59 mg/kg. This is below the site-specific "background" lead concentration of 65 mg/kg in soil agreed upon by the RWQCB and the SFRD. Given the historic average lead concentration and the current concentrations in soil, it appears unlikely that the presence of lead in Santa Rosa Creek is sourced at the site.

Petroleum product components (BTEX) were detected in deeper soil at the site; the depth at which the samples were collected appear to be within the zone of groundwater fluctuation. The source of BTEX in the deeper soil is not defined at this time.

[3] Pre-excavation sampling (Table D-1, Appendix D): 590 mg/kg in boring SRB13 at 1.5 feet bgs, 170 mg/kg in boring SRB14 at 1.5 feet bgs, and 22 mg/kg in boring SRB15 at 1.0 feet bgs; post-excavation sampling (Table 1): 140 mg/kg in boring SSR30 at 1.5 feet bgs, 11 mg/kg in boring SSR31 at 2.0 feet bgs, 5.0 mg/kg in boring SSR32 at 2.0 feet bgs, and 80 mg/kg in boring SSR33 at 2.0 feet bgs.

7.0 RECOMMENDATIONS

From observations made during this investigation, it does not appear that significant debris is present near the top of the creek embankment in the vicinity of soil borings SSR30 through SSR33. It appears that debris was present primarily in the area of the excavations. Additionally, the average lead concentration in shallow soil is below the site "background" concentration; lead concentrations in deeper soil are generally well below concentrations detected in the shallow soil. There does not appear to be a correlation between concentrations of lead detected at the site and in the creek. Based on this information, we recommend no further action with respect to lead in shallow soil at the site.

A coordinated groundwater sampling effort from existing Mead Clark Lumber Company wells between UPRR and the Mead Clark Lumber Company is planned to further evaluate the presence of petroleum hydrocarbons at the site. This sampling will be performed pending the finalization of an entry license agreement between NWPRA and the Mead Clark Lumber Company.

	23.0-23.5	8/24/00	SSR31-23.5	Benzene	0.005	<0.005
				Toluene	0.005	<0.005
				Ethylbenzene	0.005	<0.005
				Total Xylenes	0.005	<0.005
				MTBE	0.02	<0.02
SSR32	1.5-2.0	8/24/00	SSR32-2.0	Lead	5	5.0
	5.0-5.5	8/24/00	SSR32-5.5	Lead	5	7.5
	7.0-7.5	8/24/00	SSR32-7.5	Lead	5	5.6
	10.5-11.0	8/24/00	SSR32-11.0	Lead	5	8.2
	21.0-21.5	8/24/00	SSR32-21.0	Benzene	0.005	<0.005
				Toluene	0.005	0.013
				Ethylbenzene	0.005	0.015
				Total Xylenes	0.005	0.028
				MTBE	0.02	<0.02
SSR33	1.5-2.0	8/24/00	SSR33-2.0	Lead	5	**80**
	4.0-4.5	8/24/00	SSR33-4.5	Lead	5	6.9
	7.0-7.5	8/24/00	SSR33-7.5	Lead	5	7.0
	10.8-11.3	8/24/00	SSR33-11.5	Lead	5	6.6
	17.0-17.5	8/24/00	SSR33-17.5	Benzene	0.005	0.013
				Toluene	0.005	0.049
				Ethylbenzene	0.005	0.054
				Total Xylenes	0.005	0.076
				MTBE	0.02	<0.02

Notes:

1. Analytical methods were as follows:
   Lead - United State Environmental Protection Agency (EPA) Method 6010;
   Benzene, toluene, ethylbenzene, total xylenes, and MTBE - EPA Method 8021.
2. Lead results in "bold" type are those that exceed the site-specific background concentration of 65 mg/kg.
3. MTBE = Methyl tert-butyl ether.
4. MTBE concentration confirmed by EPA Method 8260.
5. < = less than reported detection limit.

addition, all monitoring wells must include *identification system* affixed to interior surface:

1) Well identification 2) Well type 3) Well depth 4) Well casing diameter 5) Perforated intervals

ell identification number and well type shall be *affixed* to the *exterior surface* security structure.

For Office Use Only
Address
Site ID#
Permit #

I hereby agree to comply with all laws and regulations of the County of Sonoma and State of California pertaining to water well construction. I will telephone (707) 565-6565, 48 hours in advance, to notify the Environmental Health Specialist when completing or destroying a well. I will furnish the Director of Health Services and the owner a legible copy of the State Water Well Driller's Report within 15 days; and a copy of the Summary Report, including sample results, should be received by this Department within 90 days in order to obtain final approval on this well permit. I acknowledge that the application will become a permit.*only* after site approval and payment of fee. I understand that this permit is not transferable and expires one year from date of issuance.

C57 # 636387

Signature of Well Driller—*no proxies* (Cory Bean Precision) Date 8/9/00

Insurance Carrier JE H Marsh Canada Limited (Policy # WCI-0811-072339-010) Expiration Date 04/23/01

Once all wells/borings are installed, submit a Well Driller's Log and/or Summary Report to complete permit process.

Indicate on attached plot plan the exact location of well(s) with respect to the following items: property lines, water bodies or water courses drainage pattern, roads, existing wells, sewer main and laterals and private sewage disposal systems or other sources of contamination or pollution. INCLUDE DIMENSIONS. The validity of this permit depends upon the accuracy of the information provided by the applicant.

Conditions of permit:

FOR OFFICE USE ONLY – ENVIRONMENTAL HEALTH DIVISION

Permit approved by John L Anderson Date 8/21/00

Const. approved by _____ Observed? [ ] Yes [ ] No Well # _____ Date ___/___/___

RWQCB approval Joan Eric Lentz Date 7/17/00

Order:	22016	**Date Collected:**	8/24/00
Project Name:	Santa Rosa	**Date Received:**	8/29/00
Project Number:	2770.005	**P.O. Number:**	Invoice UPRR
Project Notes:			

On August 29, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	Lead	EPA 6010B

Chemical analysis of these samples bas been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

Tony Choi, Project Manager
Geomatrix Consultants, Inc.
2101 Webster Street, 12th Floor
Oakland, CA 94612

Dear Mr. Choi:

Included are the results from the testing of material submitted on September 1, 2000 from your 2770.005 project. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Charlene Jensen

CASE NARRATIVE

This case narrative encompasses samples received on September 1, 2000 by Friedman & Bruya, Inc. from the Geomatrix Consultants, Inc. 2770.005 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Geomatrix Consultants, Inc.
009004-01	SSR32-17.0
009004-02	SSR32-21.0
009004-03	SSR31-16.5
009004-04	SSR31-23.5
009004-06	SSR30-16.5
009004-07	SSR30-22.0
009004-08	SSR30-25.5
009004-09	SSR33-17.5
009004-10	SSR33-21.5
009004-11	SSR33-25.5

All quality control requirements were within acceptable limits.

Date of Report: 09/18/00
Date Received: 09/01/00
Project: 2770.005
Date Extracted: 09/08/00
Date Analyzed: 09/08/00

RESULTS FROM THE ANALYSIS OF THE SOIL SAMPLE FOR FORENSIC EVALUATION BY CAPILLARY GAS CHROMATOGRAPHY USING A FLAME IONIZATION DETECTOR (FID)

Sample ID	GC Characterization
SSR32-21.0	The GC trace using the flame ionization detector (FID) showed an absence of material above the detection limit of the analysis. The detection limit for gasoline, diesel fuel, and motor oil are approximately 25, 50, and 100 ppm, respectively. The large peaks seen between 18 and 26 minutes on the GC/FID trace are surrogates added as a quality assurance check for this GC analysis.
SSR31-23.5	The GC trace using the flame ionization detector (FID) showed an absence of material above the detection limit of the analysis. The detection limit for gasoline, diesel fuel, and motor oil are approximately 25, 50, and 100 ppm, respectively. The large peaks seen between 18 and 26 minutes on the GC/FID trace are surrogates added as a quality assurance check for this GC analysis.
SSR30-22.0	The GC trace using the flame ionization detector (FID) showed an absence of material above the detection limit of the analysis. The detection limit for gasoline, diesel fuel, and motor oil are approximately 25, 50, and 100 ppm, respectively. The large peaks seen between 18 and 26 minutes on the GC/FID trace are surrogates added as a quality assurance check for this GC analysis.

Analysis For Volatile Compounds By EPA Method 8260B

Client Sample ID:	SSR30-22.0	Client:	Geomatrix Consultants, Inc.
Date Received:	09/01/00	Project:	2770.005
Date Extracted:	09/07/00	Lab ID:	009004-07
Date Analyzed:	09/07/00	Data File:	090706.D
Matrix:	Soil	Instrument:	5972 -Ins
Units:	ug/g (ppm)	Operator:	YA

Surrogates:	% Recovery:	Lower Limit:	Upper Limit:
Dibromofluoromethane	104	50	150
1,2-Dichloroethane-d4	71	50	150
Toluene-d8	227 ip	50	150
4-Bromofluorobenzene	87	50	150

Compounds:	Concentration ug/g (ppm)
Methyl t-butyl ether (MTBE)	<0.005

ip - Recovery fell outside of normal control limits. Compounds in the sample matrix interfered with the quantitation of the analyte.

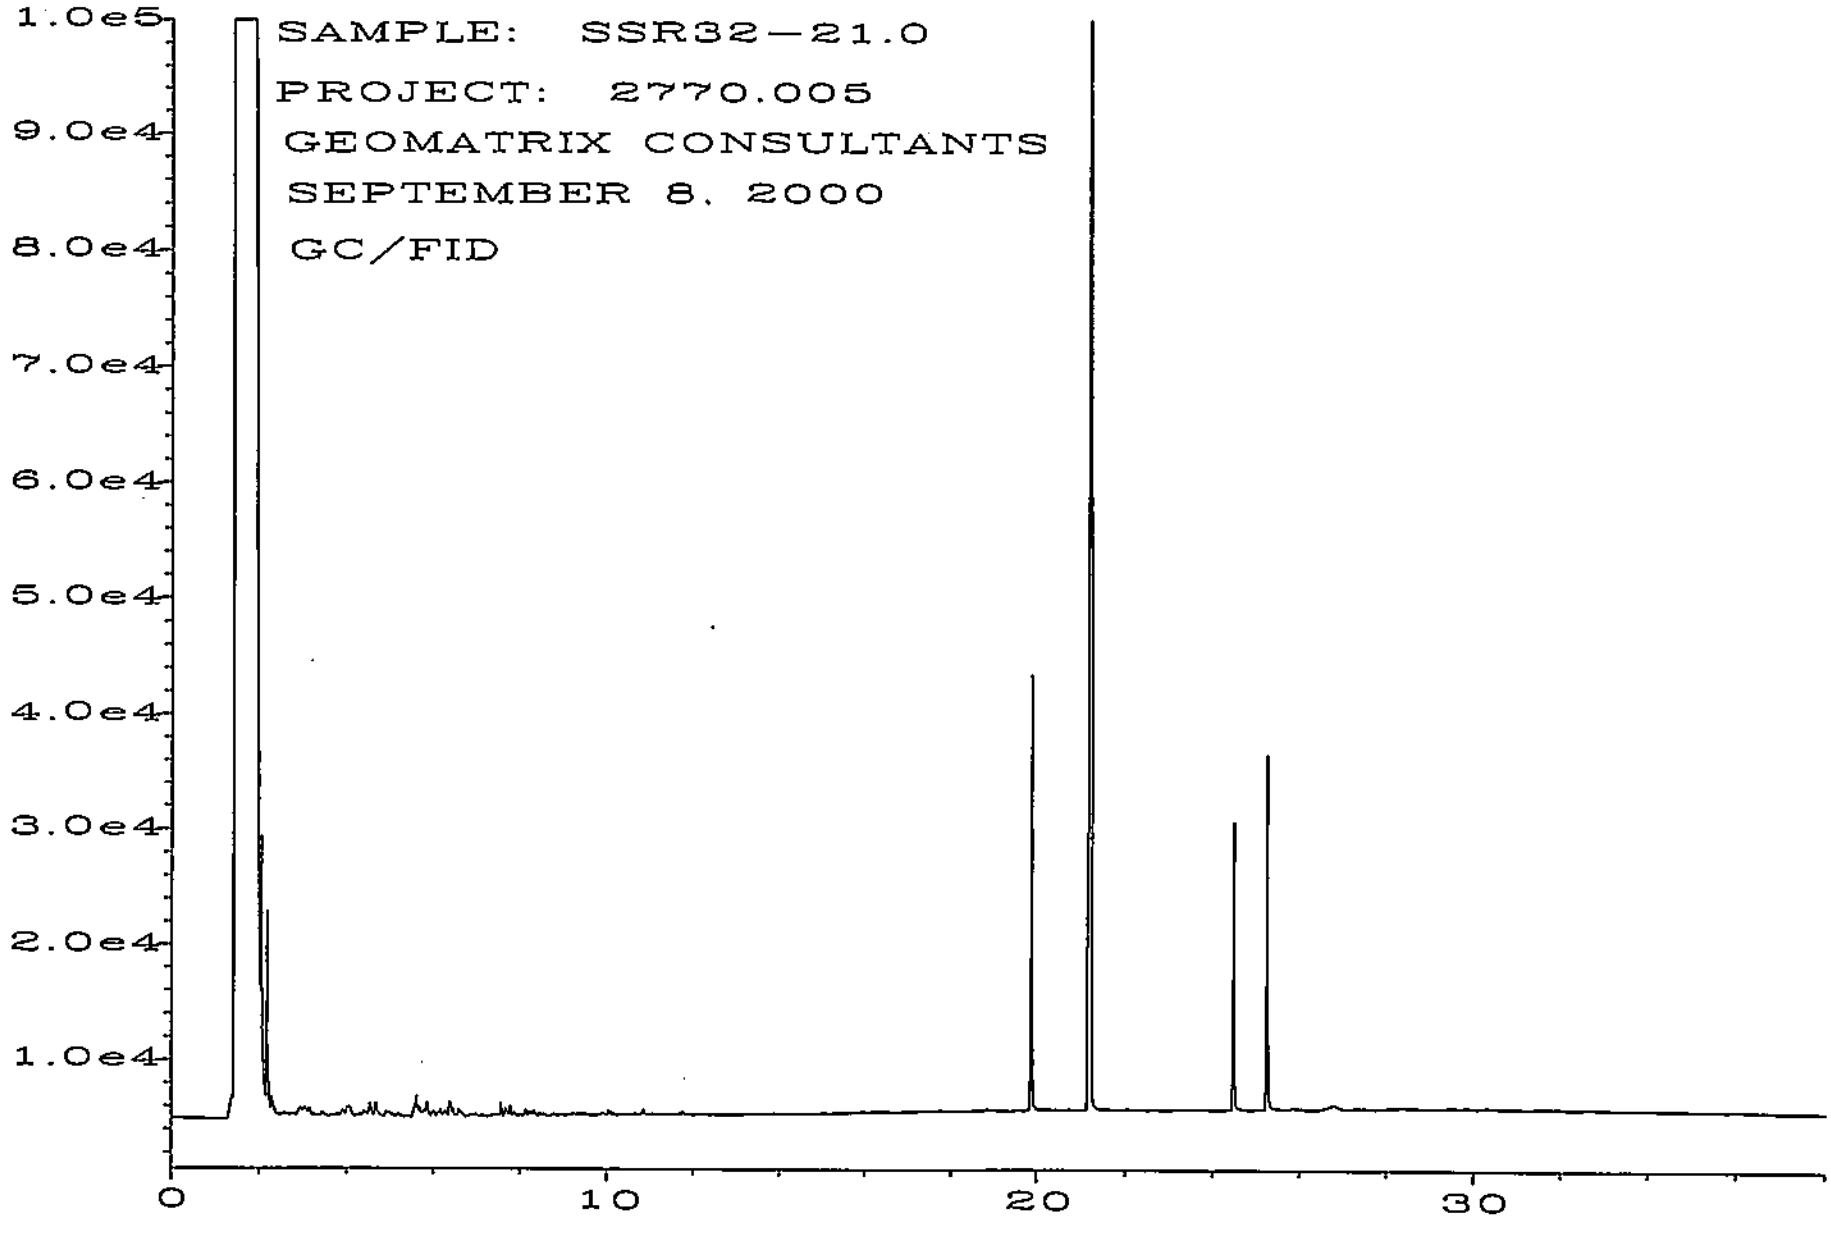
Date of Report: 09/18/00
Date Received: 09/01/00
Project: 2770.005

QUALITY ASSURANCE RESULTS FOR THE ANALYSIS OF SOIL SAMPLES FOR BENZENE, TOLUENE, ETHYLBENZENE, AND XYLENES USING EPA METHOD 8021B

Laboratory Code: 009004-09 (Duplicate)

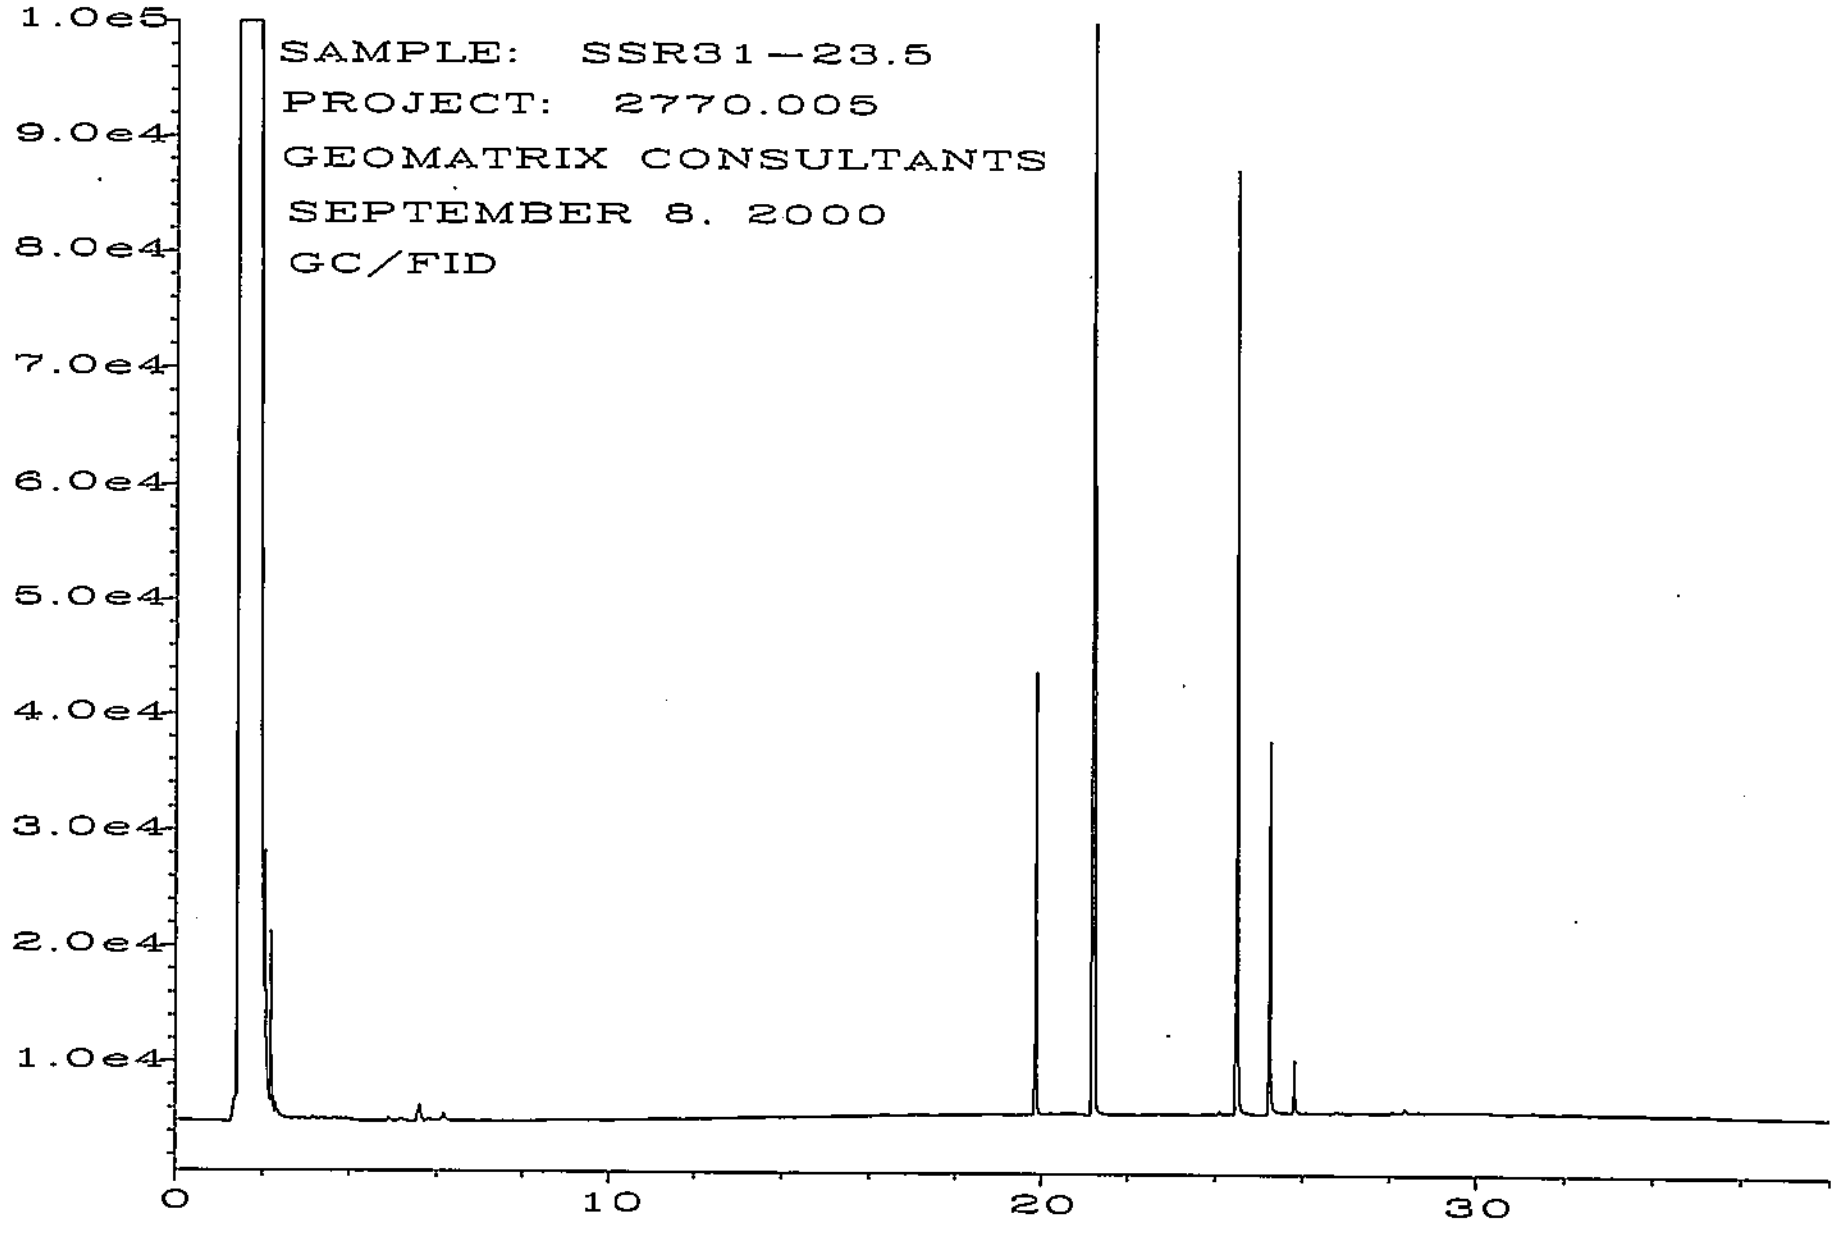
Analyte	Reporting Units	Sample Result	Duplicate Result	RPD	Acceptance Criteria
Benzene	µg/g (ppm)	0.013	0.013	0	0-20
Toluene	µg/g (ppm)	0.049	0.046	6	0-20
Ethylbenzene	µg/g (ppm)	0.054	0.066	20	0-20
Xylenes	µg/g (ppm)	0.076	0.076	0	0-20
MTBE	µg/g (ppm)	<0.02	<0.02	nm	0-20

Laboratory Code: 009004-09 (Matrix Spike)



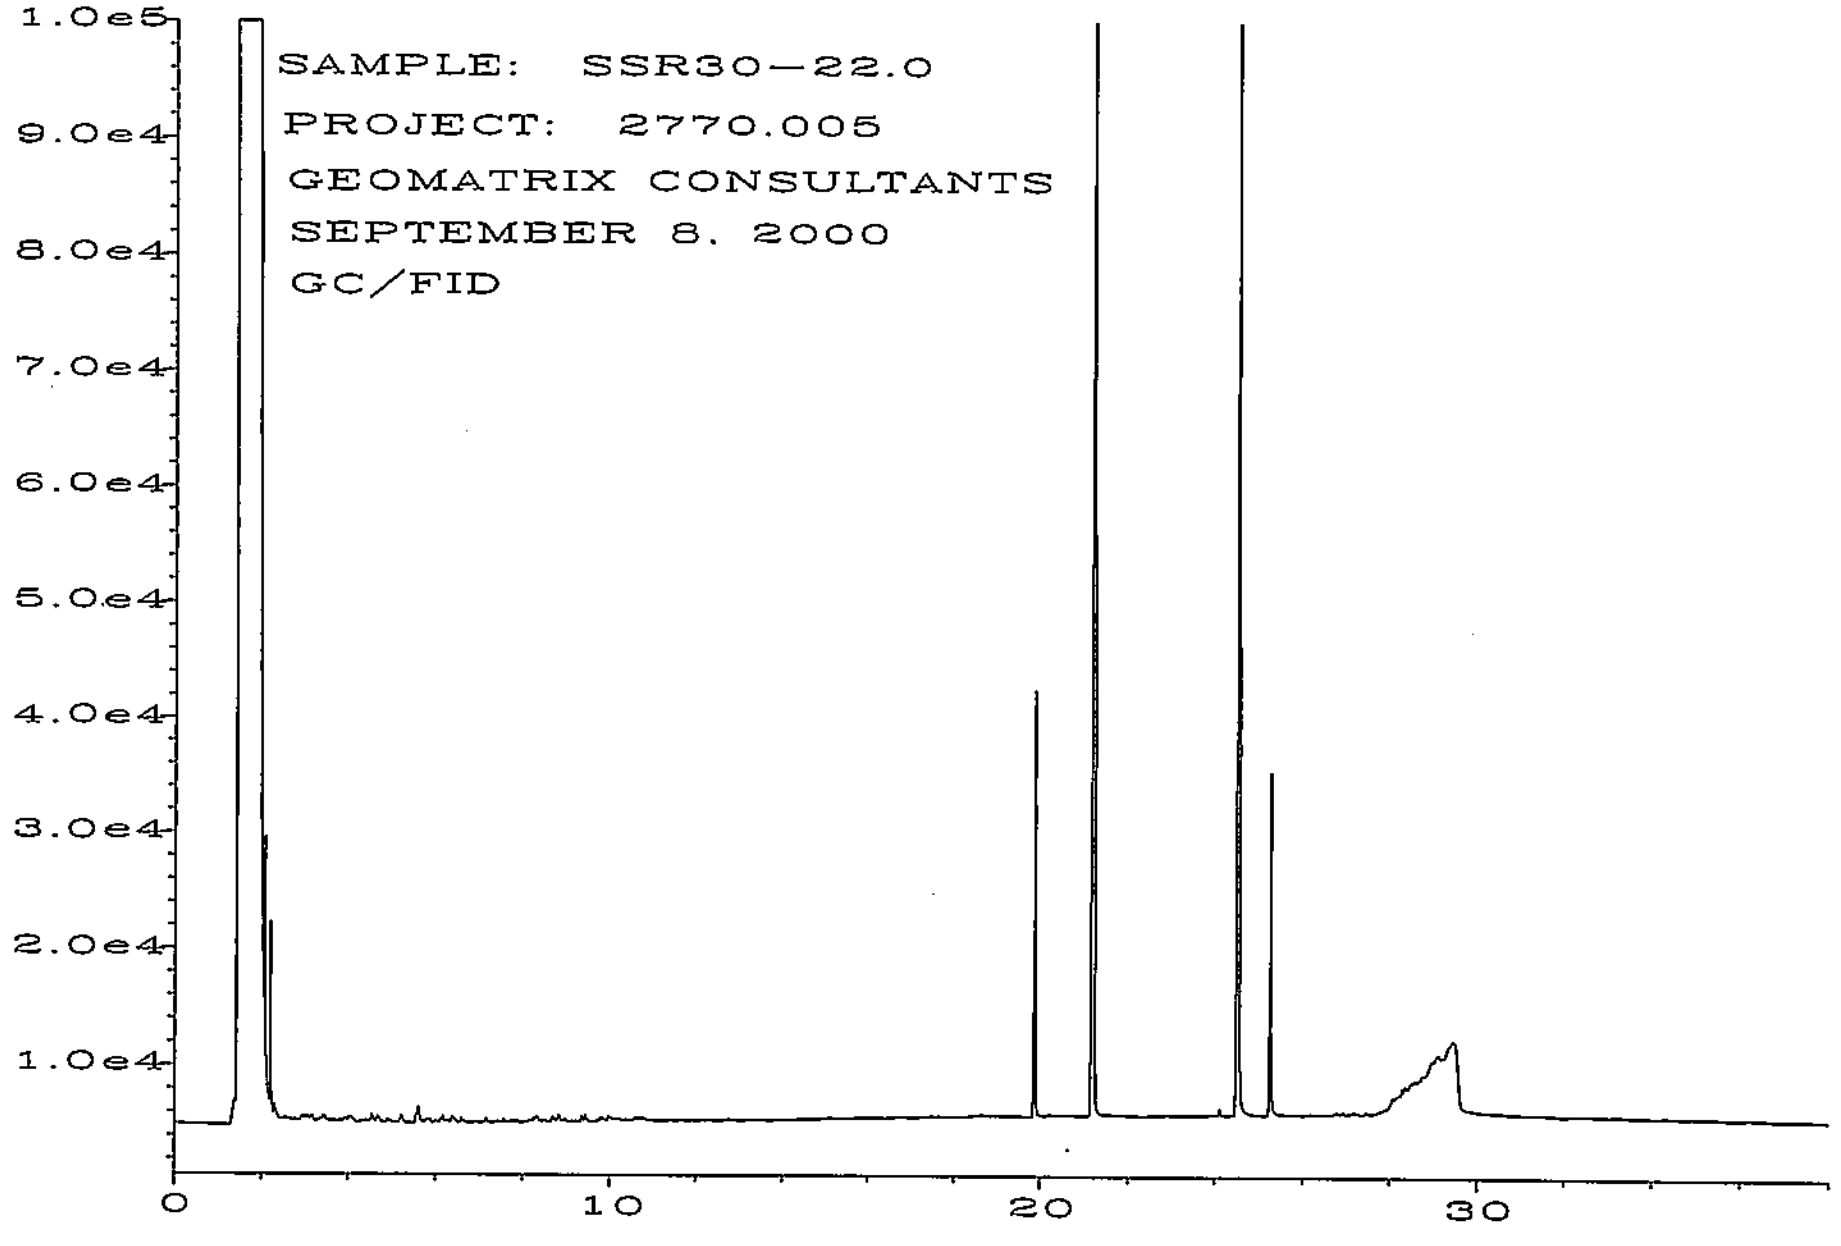
Analyte	Reporting Units	Spike Level	Sample Result	% Recovery MS	% Recovery MSD	Acceptance Criteria	RPD
Benzene	µg/g (ppm)	0.05	0.013	124	122	50-150	2
Toluene	µg/g (ppm)	0.05	0.049	137 ai	156 ai	50-150	13
Ethylbenzene	µg/g (ppm)	0.05	0.054	199 ai	137 ai	50-150	37 ai
Xylenes	µg/g (ppm)	0.15	0.076	173 ai	161 ai	50-150	7
MTBE	µg/g (ppm)	0.05	<0.02	96	97	50-150	1

Laboratory Code: Laboratory Control Sample



Analyte	Reporting Units	Spike Level	% Recovery LCS	Acceptance Criteria
Benzene	µg/g (ppm)	0.05	93	50-150
Toluene	µg/g (ppm)	0.05	93	50-150
Ethylbenzene	µg/g (ppm)	0.05	95	50-150
Xylenes	µg/g (ppm)	0.15	94	50-150
MTBE	µg/g (ppm)	0.05	94	50-150

ai- The amount spiked was insufficient to give meaningful recovery data.



nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

Oakland, CA 94612

Dear Mr. Choi:

Included are the results from the additional testing of material submitted on September 1, 2000 from your 2770.005 project.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Charlene Jensen

Subject: Environmental Site Conditions and Proposed Action Plan
Santa Rosa Station Phased Closing Property
Santa Rosa, California

Dear Ms. Fleck:

On behalf of the Union Pacific Railroad Company (UPRR), Geomatrix Consultants, Inc. (Geomatrix) is submitting this summary report of environmental conditions at the Santa Rosa Phased Closing Property (the site) based on data generated from investigations conducted at the site during the period of 1987 through 2002. This report also proposes a mitigation plan for the site.

Please call John Moe or UPRR at (415) 541-7020, or the undersigned if you have any questions.

Sincerely yours,
GEOMATRIX CONSULTANTS, INC.

ENVIRONMENTAL SITE CONDITIONS AND PROPOSED ACTION PLAN

Santa Rosa Station Phased Closing Property
Santa Rosa, California

1.0 INTRODUCTION

Geomatrix Consultants, Inc. (Geomatrix), has prepared this report on behalf of Union Pacific Railroad (UPRR), to 1) report recent investigative actions conducted at the Santa Rosa Station Phased Closing Property (the site; Figure 1); 2) summarize environmental conditions based on data obtained during the recent and previous site characterization efforts; and 3) present recommendations to address soil and groundwater containing constituents of concern. The overall objective of the recently conducted investigative activities and comprehensive evaluation discussed herein is to complete activities required by the California Regional Water Quality Control Board – North Coast Region (RWQCB) to achieve regulatory closure. This report is divided into the following sections:

- **Section 2.0 – Site Background:** describes the land use surrounding the site, subsurface utilities at the site, regional and site geology and hydrogeology, water-producing wells located near the site, and nearby known environmental sites.

- **Section 3.0 – Summary of Investigative Activities – 1987 through 2001:** summarizes site activities performed during the period of 1987 through 2001 including the removal of underground storage tanks (USTs), soil and grab groundwater sampling, monitoring well installation and sampling, and a geophysical survey. The results of these activities have been documented previously and submitted to the RWQCB.

- **Section 4.0 – Investigative Activities – 2002:** summarizes the additional activities conducted at the site in 2002, which included drilling borings for visual observation, soil and grab groundwater sampling, removal of a subsurface pipeline, and collection of additional soil samples for leachability testing. These activities are presented separately from the pre-2001 activities because they have not previously been reported to the RWQCB. Field and analytical methods applied during these activities are presented in Appendix A.

- **Section 5.0 – Results of Soil and Groundwater Investigations:** presents a summary of data collected at the site since investigations began in 1987. The data includes visual observations of soil and soil sampling; grab groundwater sampling; and monitoring well sampling analytical results. As applicable, the results are compared to published screening criteria that consider risk to human health and the environment to provide a

context for initially evaluating the results, and selecting constituents of concern (COCs) at the site.

- **Section 6.0 – Discussion of Site Conditions:** presents a conceptual site model and discussion of environmental site conditions at various areas of the site including the fenced enclosure and the area of visually impacted soil in the northwestern area of the site. The discussion of site conditions considers the COCs identified in Section 5 and the conceptual site model.

- **Section 7.0 – Site-Specific Remedial Action Objectives:** presents remedial goals for the site, considering applicable regulations and policies.

- **Section 8.0 – Development and Evaluation of Remedial Alternatives:** evaluates and presents a remedial alternative for site mitigation.

- **Section 9.0 – Implementation of Recommended Alternative:** proposes a recommended schedule to achieve site closure.

- **Section 10.0 – References:** lists references used in development of this report.

2.0 SITE BACKGROUND AND STATUS

Based on previous work conducted at the site by Geomatrix and others, this section describes the land use surrounding the site, subsurface utilities at the site, regional and site geology and hydrogeology, water producing wells located near the site, and nearby known environmental sites. For purposes of this report, site north and south are toward 6th and 3rd Streets, respectively; west is toward Santa Rosa Creek, and east is toward the Northwestern Pacific Railroad Authority (NWPRA) right-of-way.

2.1 SITE DESCRIPTION

The site is located along the NWPRA right-of-way in a commercial area of central Santa Rosa, California (Figure 1). The site, shown on Figure 2, occupies assessor parcel number (APN) 010-171-004. Currently the site is owned by UPRR and is designated for sale to the NWPRA.

The site is vacant with the exception of a chain-link fenced enclosure ("fenced enclosure") in the eastern portion of the site, which until recently was used by Northwestern Pacific Railway Company, LLC (Railways) as a maintenance and storage yard. Within the fenced enclosure are a permanent, wooden structure that appears to be an office building, a small shed that was used for storage of waste oils, and an empty octagonal structure. Potential site use under consideration includes a commuter rail station and commercial and/or mixed-use redevelopment.

2.2 HISTORICAL SITE USE AND FEATURES

The site was formerly used as a water and fuel station for the Northwestern Pacific Railroad (NWPRR; the NWPRR was acquired by the Southern Pacific Railroad Company [SPTCo] in late 1906). Within the southeastern portion of the site was a turntable that was dismantled in 1925. Also in this portion of the site was a pump house. A 3000-bbl (126,000 gallons) aboveground oil storage tank (3000-bbl AST), two oil traps, and an oil column also were located along the western boundary of the site (Figure 2). According to records maintained by the SPTCo[1], these facilities were constructed between 1939 and 1945 and were removed in 1960. A pump house was located approximately southeast of the 3000-bbl tank. An office and fuel storage house were located in the north-central portion of the site. Also in this area were three USTs (10,000-gallon diesel, 10,000-gallon gasoline and 230-gallon fuel oil). These three USTs were removed in 1987.

Information identified on historical Sanborn Fire Insurance maps (Sanborn maps) from the years 1893, 1904, 1908, and 1950 indicated the presence of an additional former oil UST in the northwestern portion of the site that may have been associated with either a fruit canning facility that was located adjacent to and west of the site or a wool mill that was partially located in the northeastern area of the site (as shown on Sanborn maps dated 1893, 1904, and 1908.

The approximate locations of these historical features are based on information from SPTCo railroad valuation maps, Sanborn maps, and figures prepared by others to report earlier investigative activities, and are shown on Figure 2.

2.3 SITE SETTING

2.3.1 Surrounding Land Use

The site is located in a primarily commercial area of Santa Rosa. It is bordered by the NWPRA property to the east and 3rd and 6th Streets to the south and north, respectively. Warehouse facilities exist to the west. Based on information from the historical Sanborn maps, petroleum USTs formerly existed off site, within the warehouse located adjacent to the central portion of the site's western boundary (Figure 2). An oil pump or tank(s) has been identified at the off-site warehouse by the RWQCB (personal communication; J. Fleck). It is not known whether the RWQCB-identified feature corresponds to the historical USTs that were depicted on the Sanborn maps and shown on Figure 2.

[1] SPTCo was purchased by UPRR in 1996.

West of the warehouse facilities and approximately 150 to 200 feet from the site is Santa Rosa Creek (Figure 2). A residential area is located west of the Creek.

2.3.2 Subsurface Utilities

Subsurface utilities located within the site boundary are presented on Figure 2. As shown on Figure 2, utilities include two City of Santa Rosa storm water lines, and two City of Santa Rosa sewer lines. The storm water lines traverse the site in an east/west direction, extending along the trends of 4th and 5th Streets, and discharge into Santa Rosa Creek. The sewer lines intersect a sewer main on the western side of the site that runs the length of the site in a north/south direction and extends to both 3rd and 6th Streets. Based on utility maps obtained from the City of Santa Rosa, the sanitary sewer is located approximately 4 to 6 feet below ground surface (bgs) at elevations ranging across the site from about 146 to 144 feet above mean sea level (msl). The utility maps do not show the depths of the storm water lines.

2.3.3 Geology and Hydrogeology

The site is located on the edge of the Santa Rosa Plain, the distal portion of a broad alluvial fan that slopes from the west from the Sonoma Mountains to Laguna de Santa Rosa. Santa Rosa Creek flows westward across the plain, draining the Sonoma Mountains and discharging into Laguna de Santa Rosa, which in turn drains northward into the Russian River. Shallow unconsolidated sediments beneath the plain consist of alluvial fan deposits dominated by lenticular beds of poorly graded gravel, sand, silt, and clay that are characterized by widely varying thicknesses and lateral grainsize gradations over short distances.

Locally the site geology is generally composed of fill, aggregate baserock, and silty sand from ground surface to approximately one foot bgs. This fill is primarily underlain by interbedded clay, sandy clay, and clay with sand to depths of up to approximately 20 feet bgs. A coarser-grained unit generally consisting of clayey sand and clayey sand with gravel was encountered at depths between 19 and 28 feet bgs (the total depth of borings at the site). Depths to saturated deposits in most project borings, as observed during drilling and documented on boring logs have ranged generally between 7 and 14 feet bgs in borings drilled between November and June; saturated deposits typically were observed at depths of 11 to 20 feet bgs in borings drilled in September.

Water levels measured over four quarters in the monitoring wells (December 2001 through September 2002) at the site show seasonal fluctuations of up to 6 feet (Table 1). Depth to groundwater in the monitoring wells has been measured between 7.55 to 18.49 feet below the

top of casing (btc), which correspond to water level elevations ranging from144.74 to 131.22 feet msl. The measured depth to groundwater was deeper in each of the five monitoring wells in September 2002; the shallowest depths to groundwater were recorded in December 2001 (Table 1). Groundwater flow is to the west-southwest, toward Santa Rosa Creek. The horizontal hydraulic gradient, based on June 2002 water level measurements, is calculated to be approximately 0.02 foot per foot (ft/ft) (that is, the depth to groundwater, based on water-level measurement data, increases 2 ft for every 100 ft across the site in the direction of groundwater flow). A potentiometric surface map produced from groundwater levels measured in June 2002 is shown on Figure 3.

2.3.4 Nearby Water-Producing Wells

Domestic and industrial water supply for the site vicinity is provided through the City of Santa Rosa, which purchases water from the Sonoma County Water Agency (SCWA). The SCWA delivers water to the City via the Sonoma County aqueduct. The source of the water is the Russian River, which in turn is fed by three main upstream reservoirs. The City of Santa Rosa also has eight standby wells to pump groundwater for emergency purposes; these wells currently are not in use.

Information provided by the City of Santa Rosa Utilities Department (SRUD) indicates that 50 groundwater wells are located within a half mile of the site (Figure 4). Of these wells, 21 are located within a half mile generally to the north (hydraulically up- and cross-gradient of the site) and 29 are located within a half mile generally to the south (hydraulically downgradient of the site). Of the 50 wells, only four are located within a one-quarter mile radius, with two wells located approximately upgradient and two approximately downgradient.

Based on conversations with SRUD personnel, only two of the residences located within one-half mile from the site are not connected to the City of Santa Rosa water supply. These residences are located at 654 and 658 Dutton Avenue. Uses for the wells are not tracked by SRUD in all cases, but records indicate that the wells within one-quarter mile of the site are used for irrigation and external use.

Information about the possible presence of an additional water producing well located near the site was provided by the RWQCB (personal communication with J. Fleck, August 2002). This well was not included in the SRUD database. The well is located to the west of the site between the site and Santa Rosa Creek (Figure 4); its actual location has not been field-verified. At this time the well is not in use, and based on a conversation with the site redeveloper, the

well will not be used in the future and will be appropriately destroyed (personal communication between N. Jellison, representing NWPRA and John Stewart of John Stewart Company).

2.3.5 Nearby Environmental Sites

Nearby properties with documented impacted groundwater were identified during a preliminary environmental assessment of the site performed by Geomatrix in the early 1990s (since that time, it is likely that some of these sites have been closed). These properties include the La Rose Hotel site at 101 5th Street (impacted by total petroleum hydrocarbons [TPH] as gasoline [TPHg] and as diesel [TPHd]), the Grace Brothers Hotel site at 200 2nd Street (impacted by metals, TPHd, and TPH as motor oil [TPHmo]), and the Mead Clark Lumber Company (Mead Clark) site (impacted by TPHg, TPHd, and related fuel constituents). The La Rose and Grace Brothers properties are assumed to be hydraulically upgradient of the site, assuming a southwesterly to westerly groundwater flow direction (toward Santa Rosa Creek). The Mead Clark site appears to be hydraulically cross-gradient. An active fuel leak case, the Ochipinti Gas Station, located at 210 5th Street, is located hydraulically upgradient of the site. Constituents detected at the gas station and downgradient towards the site include TPHg, benzene and other aromatic constituents, and methyl tertiary butyl ether (MTBE). We understand that the distribution and downgradient extent of these constituents in groundwater from the Ochipinti Gas Station have not been fully defined (as of August 2002) and that groundwater mitigation efforts have not been initiated. Based on its location upgradient of the site, it is likely that constituents in groundwater from the Ochipinti Gas Station will impact, or already have impacted the site.

3.0 SUMMARY OF INVESTIGATIVE ACTIVITIES – 1987 THROUGH 2001

Subsurface investigations have been performed at the site since 1987. These investigations have included:

- soil sampling by others related to the removal of three USTs;
- installation of monitoring wells by others as part of the nearby Mead Clark facility groundwater investigation;
- soil sampling and groundwater sampling from monitoring wells by the RWQCB to evaluate whether the site was a possible source of petroleum hydrocarbons and related constituents that were detected at Santa Rosa Creek; these wells subsequently were destroyed by the RWQCB; and,

- soil and grab groundwater sampling, and monitoring well installation and sampling to meet the RWQCB requirements for site closure.

The following sections provide a summary of the subsurface investigations performed by Geomatrix and others at the site from 1987 through 2001. A summary of the borings and types of samples collected are presented on Table 2. Soil and groundwater sampling locations are shown on Figure 5 (this figure also shows sampling locations from the recent field activities, which are discussed in Section 4.0). The results of the subsurface investigations described below have been reported to the RWQCB; the respective reports that document these activities and results are referenced in each section.

The recent investigative activities performed at the site are reported in Section 4.0. Results of the former and recent site characterization activities are discussed in aggregate in Section 5.0.

3.1 REMOVAL OF UNDERGROUND STORAGE TANKS

In December 1987, Canonie Environmental Services Corporation (Canonie) removed three USTs from the site (Industrial Compliance [IC], 1992). These included a 230-gallon fuel oil UST, a 10,000-gallon diesel UST, and a 10,000-gallon gasoline UST, which were located within and northwest of the existing fenced enclosure. During UST removal activities, no holes or signs of leakage or overfilling were noted for any of the tanks. TPH were not detected above laboratory reporting limits in the soil samples collected from beneath the USTs.

3.2 MONITORING WELL INSTALLATION AND SAMPLING

Monitoring wells were installed at the site as part of the investigation of off-site groundwater impacts from the Mead-Clark facility, which is located southeast and hydraulically cross-gradient to the site. In April 1988, on behalf of Mead Clark, Harding Lawson Associates, Inc. (HLA), installed two monitoring wells, GW-24 and GW-27, on the site (Environet, 1997 and 1998). These wells are located generally in the south-central portion of the site (Figure 5). Groundwater samples were analyzed for chlorinated volatile organic compounds (CVOCs) and TPH and related constituents over at least six monitoring events (HLA, 1991). Analytical results for samples collected from wells GW-24 and GW-27 are included in Table 3. Well construction details are presented in Appendix B.

In April 1990, the RWQCB installed two groundwater monitoring wells on site (RBMW-2 and RBMW-3; Figure 5) to evaluate the potential source of TPH and related constituents in Santa Rosa Creek (RWQCB, 1993). These wells were located in the central portion of the site. Soil

samples collected from borings RBMW-2 and RBMW-3 were analyzed for TPHg, TPHd, TPH as oil and grease (TPHog), benzene, toluene, ethylbenzene, total xylenes (BTEX, respectively), and polynuclear aromatic hydrocarbons (PAHs). Well construction details are presented in Appendix B. In addition to the analytes listed above, groundwater samples also were analyzed for chlorinated volatile organic compounds (CVOCs). Soil and groundwater analytical results are presented in Table 3. The RWQCB destroyed monitoring wells RBMW-2 and RBMW-3 in June 1995 (personal communication with J. Fleck, October 30, 1996).

At the request of the RWQCB, Geomatrix installed five monitoring wells at on- and off-site locations in September 2001 (Geomatrix, 2001). The purpose of these wells was to: 1) obtain groundwater flow information; 2) identify the possible presence of separate-phase petroleum hydrocarbons (SPPH)[2] at specific locations; 3) characterize the presence of dissolved-phase petroleum constituents in groundwater; and 4) investigate whether dissolved-phase petroleum constituents are migrating onto the site. The locations of the monitoring wells, designated as SRMW-05 through SRMW-08 and SRMW-10 are shown on Figure 5. Groundwater samples initially were collected from these wells in December 2001, and have been collected quarterly since that time (a total of four monitoring events to date). Groundwater samples have been analyzed for TPHg, TPHd, TPHmo, BTEX, MTBE, and PAHs. Groundwater analytical results from monitoring wells SRMW-05 through SRMW-08 and SRMW-10 are summarized in Table 4.

3.3 SOIL SAMPLING

Soil samples were collected in the central portion of the site (Figure 5) for chemical analysis from two borings, RBB-1 and RBB-2, drilled by the RWQCB in April 1990. Samples collected from these two borings were analyzed for TPHg, TPHd, TPHog, BTEX, and PAHs. Soil analytical results are included in Table 3.

In 1992, Industrial Compliance (IC) collected soil samples at five locations (IC-B1 through IC-B4 and IC-B6) in the vicinity of the former 10,000-gallon gasoline UST, 10,000-gallon diesel UST, and 230-gallon fuel oil UST to further evaluate potential environmental impacts from the former USTs (Figure 5). Soil samples were analyzed for TPHg, TPHd, TPHmo, TPH as kerosene (TPHk), BTEX, and PAHs (Industrial Compliance, 1992). Analytical results for these samples are included in Table 3.

[2] For purposes of this report, the terminology separate phase petroleum hydrocarbons (SPPH) describes product in the subsurface that can readily flow into monitoring wells.

Soil samples were collected from 33 borings during various phases of sampling by Geomatrix during the period of 1996 and 2001 (Geomatrix 1997, 2000, 2001, and 2002a). Samples for chemical analyses and leachability testing have been collected primarily at targeted locations to evaluate potential environmental impacts from historical railroad operations and at specific locations requested by the RWQCB. The locations and purposes of the soil borings are presented on Table 2. Selected soil samples have been analyzed for:

- Metals, including antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc;
- Total petroleum hydrocarbons characterized as gas, diesel, and motor oil (TPHg, TPHd, and TPHmo, respectively);
- Benzene, toluene, ethylbenzene, and xylenes (BTEX);
- Chlorinated volatile organic compounds (CVOCs);
- Methyl teriary butyl ether (MTBE); and
- Polynuclear aromatic compounds (PAHs).

Analytical results and testing methods for soil samples collected by Geomatrix are tabulated in Tables 5 through 8.

Leachability testing on selected samples was conducted in January 2000 using the Waste Extraction Test (WET) procedure modified using deionized water as the extract. The WET is a dynamic procedure in which a fixed weight of soil and volume of extract are combined, and then placed on a shaking table for 48 hours. Following this procedure, the extract is decanted and analyzed. This procedure is aggressive relative to in-ground conditions as the procedure disrupts the soil structure such that equilibrium partitioning will be achieved among the aqueous and non-aqueous phases present. Whereas, in situ, groundwater migrates past the constituents in the soil without disrupting the soil structure and without achieving equilibrium conditions in the bulk of the water. Nevertheless, the WET test is a method generally accepted by the regulatory agencies to provide a preliminary estimate of the potential for constituents detected in on-site soil (in this case, TPH and PAHs), to leach out of the soil matrix. The results of these analyses are presented in Table 9.

3.4 GRAB GROUNDWATER SAMPLING

Grab groundwater sampling is used as a screening tool to provide a one-time groundwater sample for chemical analysis; this methodology provides an initial screening of environmental conditions at a site. Grab groundwater sampling has been used extensively at the site, and was recently supplemented by samples from site monitoring wells to confirm selected grab groundwater analytical results and provide longer term, replicable data (Section 3.2).

Grab groundwater samples were collected at five locations (IC-B1 through IC-B4 and IC-B6) at the site by IC in 1992 to evaluate potential environmental impacts from the two 10,000-gallon USTs and the 230-gallon UST that were removed in 1987 (Canonie, 1987). These samples were analyzed for TPHg, TPHd, and BTEX. Analytical results are presented in Table 3.

Grab groundwater samples were collected by Geomatrix from 36 on- and off-site borings prior to the recent characterization activities (Section 4.0). These samples were collected during various phases of investigation to evaluate potential environmental impacts from historical features, features identified during the various investigations, and to respond to requests by the RWQCB for additional characterization. The grab groundwater boring designations and their purposes are summarized on Table 2. Selected grab groundwater samples have been analyzed for:

- Total petroleum hydrocarbons characterized as gas, diesel, and motor oil (TPHg, TPHd, and TPHmo, respectively);
- Benzene, toluene, ethylbenzene, and xylenes (BTEX);
- Chlorinated volatile organic compounds (CVOCs);
- Methyl tertiary butyl ether (MTBE); and,
- Polynuclear aromatic compounds (PAHs).

The analytical results and testing methods for these samples are presented in Table 10.

3.5 GEOPHYSICAL SURVEY

To evaluate the presence of an oil UST in the northwestern portion of the site that was identified on a historical Sanborn map, a geophysical survey was conducted in September 2001 (Appendix C). The findings of the geophysical survey indicated shallow, subsurface anomalies in three primary areas; the geophysical surveyor concluded that an UST could be present in one

of the three areas, and the anomalies detected at the other two areas likely represented metallic debris.

To confirm these conclusions, excavations were conducted in October 2001 to reveal the subsurface anomalies. Excavation was conducted to depths of approximately 7.5 feet bgs in each of the identified areas. Observations made during the excavations confirmed the presence of some miscellaneous metallic debris in the two areas where these materials were suspected. No UST was found in the area where an UST was suspected; however, two parallel subsurface pipes were observed, and an apparent subsurface manifold with three vertical pipes that previously extended to ground surface were uncovered. These pipelines were removed in June 2002; details of the pipeline removal are presented in Section 4.3.

4.0 INVESTIGATIVE ACTIVITIES AND ACTIONS – 2002

Additional activities were performed in June, July, August and November 2002 to 1) evaluate the extent of soil that appeared to contain petroleum (visually impacted soil) in the northwestern area of the site; 2) further investigate the presence of petroleum constituents in groundwater in the vicinity of the former 3000-bbl AST; 3) further address whether historical and recent maintenance activities within the fenced enclosure may have impacted shallow soil and contributed to the presence of MTBE that had been detected in groundwater in this area; 4) remove the pipeline that was identified in the northwestern portion of the site from the geophysical survey performed in 2001; and, 5) further evaluate the potential long-term leachability of petroleum in soil to groundwater. These activities, which have not previously been formally documented, are reported below; the findings from this work are discussed in aggregate with the results of previous soil and groundwater investigations in Section 5.0.

Investigative activities included soil and grab groundwater sampling. The sampling activities were performed according to work plans prepared by Geomatrix (Geomatrix 2002b, 2002c, 2002d and 2002e) and were field-modified as appropriate and with concurrence from the RWQCB. The specific activities performed by Geomatrix are described below. Field and analytical methods are described in Appendix A. A summary of the borings and their respective purposes is presented in Table 2.

4.1 SOIL BORINGS IN NORTHWESTERN AREA

Borings SRB-63 through SRB-69, SRB-75 through SRB-95, and SRB-97 through SRB-103 were advanced in the northwestern portion of the site (Figure 6) during the recent investigation to evaluate the lateral and vertical extent of visually impacted soil that previously had been

observed in borings in this area. Boring logs documenting lithology, photo-ionization detector (PID) measurements, and visual observations during drilling are included in Appendix D. Soil samples from 13 borings were collected from above, within, and below the locations of visually impacted soil and submitted for chemical analysis for TPHd, TPHmo, and PAHs. Additionally, selected soil samples were analyzed for TPH characterized as Bunker C. Soil samples from eight borings also were analyzed for BTEX and MTBE. Analytical testing methods and results for the soil samples are presented in Tables 6 through 8, and are discussed in Section 5.0.

To further characterize groundwater near the former 3000-bbl AST, grab groundwater samples were collected from boring locations SRB-75, SRB-76, and SRB-77. These grab groundwater samples were analyzed for TPHg, TPHd, TPHmo, BTEX, and MTBE. Grab groundwater analytical testing methods and results are presented in Table 10, and are discussed in Section 5.0

To further evaluate the potential long-term leachability of TPH from soil to groundwater, additional soil samples were collected at selected locations and depths where the presence of TPH in soil was identified from borings PL-03L, PL-05L, and PL-12L along the pipeline alignment, SRB-100L (near the former 3000-bbl aboveground storage tank), and SRB-53L, SRB-79L, and SRB-88L (in the general northwestern site area). Soil samples were analyzed for total TPHd and TPHmo using EPA Method 8015. The potential leachability of TPH from the soil was evaluated using the WET, modified using deionized water as the extract. Analytical testing methods and results are presented in Table 9.

Chain of custody records and laboratory analytical results for the soil and grab groundwater samples are contained in Appendix E; leachability analytical results are contained in Appendix F.

4.2 SAMPLING WITHIN THE FENCED ENCLOSURE

Five shallow borings and one deeper boring were advanced within the fenced enclosure to evaluate potential impacts from certain recent and historical features. Specifically, shallow soil samples were collected from borings SRB-70 and SRB-71, located beneath the former storage trailer, to investigate potential chemical spillage; from boring SRB-72, located adjacent to SRB-56, to further characterize the presence of chemical constituents in soil at this location; and from borings SRB-73 and SRB-96, located to investigate potential spillage from the former AST. A deeper boring, SRB-74, was advanced near the former 230-gallon fuel oil UST and borings IC-B6 and SRB-39 to collect soil and grab groundwater samples to confirm the absence

of soil and groundwater impacts from the former UST. Boring SRB-74 served a dual purpose as it was drilled at a location selected with the RWQCB to also characterize potential impacts from a vertical corrugated metal pipe of unknown use that is present east of the former UST location. Sample locations are shown on Figure 7. Logs for these borings that document lithology, PID measurements, and visual observations are included in Appendix D. Analytical testing methods and results for the soil and grab groundwater samples are presented in Tables 6 through 8 and Table 10, and are discussed in Section 5.0. Chain of custody records and laboratory analytical results are contained in Appendix E.

4.3 REMOVAL OF SUBSURFACE PIPELINE

The subsurface pipeline identified in the northwestern area of the site was removed under the direction of Geomatrix by Clearwater Environmental Management, Inc., of Fremont, California in June 2002. A description of pipeline removal activities is presented in Appendix A. Following pipeline removal, soil samples were collected from immediately below the bottom of the pipeline in the excavation at approximately 20-foot intervals, or at locations of pipeline joints. This work was performed in accordance with the work plan approved by the Santa Rosa Fire Department (Geomatrix, 2002b). These sample locations were designated PL-01 through PL-12 (Figure 6). Additional sampling was conducted in July 2002 to collect deeper soil samples at previous shallow sample locations where elevated TPHd and TPHmo concentrations were detected.

Soil samples were analyzed for TPHd, TPHmo, and BTEX. Selected samples also were analyzed for PAHs. The analytical testing methods and results are presented in Tables 6, 7 and 8, and are discussed in Section 5.0. Chain of custody records and laboratory analytical results are contained in Appendix E.

5.0 RESULTS OF SOIL AND GROUNDWATER INVESTIGATIONS

The following subsections discuss, in aggregate, the results of soil and groundwater investigations conducted by Geomatrix and others from 1987 through the recent investigation performed in 2002. Where applicable, the results are discussed by area of the site, which include:

- the northwestern area (including the location of the former subsurface pipeline; Figures 5 and 6);
- the fenced enclosure (Figures 5 and 7); and

- the remainder of the site presented as "site-wide" results (Figure 5).

For clarification, the borings where analytical testing was performed within each area are shown in the table below.

Borings Included in Each Area

Northwestern Area (44 borings)	Fenced Enclosure (10 borings)	Site-Wide (24 borings)
SRB-22, 23, 33-35, 44, 46, 48, 51, 52, 53L, 54, 75-77, 79L, 79-81, 83, 88, 88L, 90, 91, 93, 99-101, 100L, 103, PL-01 - PL-12, PL-06L, PL-12L	SRB-27, 28, 39, 56, 62, 70-74, 96	SRB-20, 21, 24-26, 29-32, 36-38, 40-43, 45, 47, 49, 50, 55, 58-61

5.1 VISUAL OBSERVATIONS OF SOIL

Limited surface soil staining due to petroleum hydrocarbons has been observed at various locations at the site; where present, samples of this surface soil have been collected for chemical testing and the analytical results are presented in Section 5.2. Additionally, soil that contains thread-like petroleum ganglia (visually impacted soil) was observed in the subsurface in borings in the northwestern area of the site (Figure 6) during investigations performed in 2000 and 2002. The source of the petroleum ganglia is not specifically known; however, potential sources likely include the subsurface pipeline and possibly other oil handling and containment features in the northwestern portion of the site (such as the 3000-bbl AST). The distribution of the visually impacted soil is discussed in this section, and analytical results for selected soil samples collected within the visually impacted area are presented in Section 5.2.

A total of 34 borings were advanced in the northwestern area to assess the presence of visually impacted soil (Figure 6 and Table 11). Of these, no visual impacts were observed in 16 of the borings, which serve to bound the areas of visually impacted soil. There appear to be two distinct distributions of visually impacted soil (Figure 8): one distribution occurs north to northeast (assuming north is towards 6th Street) of the approximate former location of the 3000-bbl AST. This area covers approximately 1600 square feet, based on observations of visually impacted soil in four borings that occurred at varying thicknesses and depths. In boring SRB-99, visually impacted soil extends from 16 to 22 feet bgs (the bottom of the

boring); in contrast, visually impacted soil was observed in boring SRB-75 over a 3-inch interval that extends from 18.75 to 19 feet bgs (Table 11).

The second area is west of the former pipeline and is estimated to cover an area of about 7,800 square feet; the presence of visually impacted soil in this area was observed in 20 borings. Specifically, visually impacted soil was observed in boring SRB-53 starting at a depth of about 1 foot bgs; visually impacted soil was observed in nearby borings SRB-68, SRB-69, SRB-78, and SRB-79 starting at depths of 3 feet and 4 feet bgs (Table 11). In other borings, no visually impacted soil was observed until at least 10 feet bgs.

5.2 SOIL ANALYTICAL RESULTS

The analytical results for soil are compared relative to published criteria, where applicable. These criteria described below, are general, and serve as a benchmark to initially evaluate analytical data and identify potential constituents of concern (COCs).

Metals in soil are naturally-occurring, and their presence is not necessarily the result of anthropogenic impacts. To initially evaluate the presence of metals, concentrations were compared to the following criteria:

- Waste Classification Criteria: Total threshold limit concentrations (TTLC) and soluble threshold limit concentrations (STLCs) are used to classify material as hazardous or non-hazardous for disposal purposes. TTLCs and STLCs are codified in the California Code of Regulations (CCR), Title 22, Section 66216.24. These criteria are not strictly applicable to in-place soil; however, they are used as a tool to evaluate whether additional evaluation is warranted. For screening purposes, a value 10 times the metal's respective STLC is used to provide an initial evaluation of whether a soil could be classified as a hazardous waste (analytical testing is required to ascertain the actual soil classification for disposal). TTLCs and STLCs are listed in Table 5.

- Preliminary Remediation Goals: Preliminary remediation goals (PRGs) are health-based criteria that have been established by the U.S. Environmental Protection Agency, Region 9 (U.S. EPA, 2000). These criteria are used to initially screen metals (and other constituents, such as PAHs) in environmental media, and can be used to trigger further evaluation. For screening purposes, metals concentrations are compared to residential PRGs. However, as stated in Section 2.1, a potential future site use under consideration includes a commuter rail station and commercial and/or mixed use redevelopment. Therefore, PRGs for industrial/commercial site use also are used in evaluating the metals data. PRGs for metals are listed in Table 5.

- Background Concentrations: Where site data for metals do not appear consistent with PRGs, additional scrutiny of the data was performed to evaluate whether detected metal

concentrations likely represent background or should be identified as COCs. For this evaluation, a metal was considered to be present at a background concentration if sufficient data were available to demonstrate that the lateral and vertical distribution of metals concentrations across the site were similar.

Similarly, concentrations of PAHs, BTEX, and MTBE in soil were compared to residential and commercial/industrial PRGs; these PRGs are presented on Table 7 for PAHs and Table 8 for BTEX and MTBE. As an initial assessment of the potential for these organic constituents to migrate to groundwater, their concentrations also were compared to the generic soil screening levels (SSLs) in the U.S. EPA PRG table. The SSLs were developed by the U.S. EPA using default values in standardized equations, and are presented for two cases: 1) a dilution attenuation factor (DAF) of 20 is used to account for natural processes in the subsurface that would reduce soluble constituent concentrations between the source (soil) and the receptor (groundwater); and, 2) no dilution or attenuation of the constituents would occur between the soil and groundwater (DAF of 1). It is reasonable to assume that some dilution and attenuation of constituents detected in soil at the site would occur; however, to be conservative, site data is compared to the range of SSLs using both DAF assumptions. In this report, the SSL using a DAF of 20 is referred to as SSL_{20} and the SSL using a DAF of 1 is referred to as SSL_1.

In addition to the quantitative criteria discussed above, concentrations of metals, PAHs, BTEX, and MTBE in soil are discussed based on the frequency of detections and their vertical distribution.

There is no specific screening criteria for petroleum hydrocarbons. Therefore, petroleum hydrocarbon data also are discussed based on relative concentrations, location, frequency, and vertical distribution.

5.2.1 Metals

The analytical results for metals in soil samples are summarized in Table 5. Where detected, metals concentrations in soil were less than their respective TTLC and generally less than 10 times the STLC in all of the soil samples, with the exception of lead in shallow soil samples (at 1.0 feet bgs) from SRB-32 (57 mg/kg), SRB-39 (77 mg/kg), and SRB-40 (110 mg/kg); 10 times the STLC concentration for lead is 50 mg/kg. Lead was not detected above laboratory reporting limits or at low concentrations in deeper soil samples at each of these boring locations. On a site-wide basis, the 95% upper confidence limit of the arithmetic mean concentration (95% UCL) for lead is 22, which is below 10 times the STLC.

Concentrations of all metals detected in soil samples also were below both residential and industrial PRGs, with the exception of arsenic, which was consistently detected above its residential and industrial PRG of 0.39 and 2.7 mg/kg, respectively, and thallium, which was consistently detected at a concentration above its residential PRG of 5.2 mg/kg (but well below its industrial PRG of 130 mg/kg). These two metals are discussed below.

Arsenic was consistently detected at concentrations comparable to background concentrations for the site (concentrations ranged from less than 0.5 to 7.6 mg/kg)[3], except at boring locations SRB-40 and SRB-41. At these locations, arsenic detections ranged between not detected (detection limit of 5 mg/kg) and 27 mg/kg. Higher arsenic concentrations in these borings were detected in samples collected at depths of 4.5 and 7.5 feet bgs in boring SRB-40, and at depths of 1, 4, 5, and 7.5 feet bgs from boring SRB-41. These borings are located near the western site boundary in the central portion of the site and approximately at the location of a former oil trap and area where discolored soil was observed during site reconnaissance in 1992.

The arsenic carcinogenic residential PRG (0.39 mg/kg), which corresponds to a theoretical excess lifetime cancer risk of one-in-one million ($1x10^{-6}$), is often lower than naturally-occurring background concentrations in soil. Since U.S. EPA does not require remediation to reduce concentrations to values below natural background levels, U.S. EPA Region 9 has, at times, used the non-cancer residential PRG (22 mg/kg) to evaluate sites, recognizing that this value may be above background, yet still falls within the range of soil concentrations (0.39 to 39 mg/kg for residential land use) that equate to U.S. EPA's acceptable cancer risk range of $1x10^{-6}$ to $1x10^{-4}$. U.S. EPA has indicated that risk values in the range of 10^{-6} to 10^{-4} may be acceptable, depending on factors that include the size and nature of the exposed population, with 10^{-6} as a nominal threshold of concern for exposures to the general public. Although the concentrations of arsenic detected at SRB-40 and SRB-41 are below or near the non-cancer PRG and fall within the acceptable cancer risk range, these borings are near a former oil trap and discolored soil, and concentrations of arsenic in soil at these locations are above background and likely represent a localized environmental impact from historical site operations.

[3] The range in concentrations of arsenic at the site is consistent with studies conducted in California to assess naturally-occurring arsenic concentrations. The Kearny Foundation of Soil Science (Kearney, 1996) reports naturally-occurring arsenic at concentrations ranging between 0.6 and 11 mg/kg. A study conducted by the Lawrence Berkeley National Laboratory in the East Bay Hills showed background concentrations in soil (using the 95% upper confidence limit) ranging between 9.3 and 31 mg/kg for different geologic formations.

Thallium concentrations across the site are consistent laterally and vertically. These consistent concentrations indicate that this metal is present at its background concentration for this area.

Based on these data, there is no environmental impact from metals at the site, with the exception of arsenic at borings SRB-40 and SRB-41.

5.2.2 Petroleum Hydrocarbons

The analytical results for petroleum hydrocarbons in soil samples are summarized in Table 6 and presented on Figure 9; the results are discussed herein by petroleum characterization.

Total petroleum hydrocarbons characterized as gasoline

Twenty-two soil samples collected from within the fenced enclosure (including a sample from IC-B6 collected by Industrial Compliance in 1992; Figure 7) were analyzed for TPHg. Of these, TPHg was detected only in one sample from each of two borings (SRB-73 and SRB-96) at concentrations of 2.5 mg/kg in the sample from 3 feet bgs and 13 mg/kg from the surface sample at 0.5 feet bgs, respectively (Figure 9). At each sample location, no TPHg was detected above the laboratory detection limit in the next deeper sample.

Total petroleum hydrocarbons characterized as diesel

Soil samples were collected throughout the site for analysis of TPHd from depths up to 27.5 feet bgs (Figure 9 and Table 6). TPHd detected at the site are degraded, based on its chromatographic fingerprint; these results are consistent with the fact that the primary facilities and operations at the site were decommissioned/discontinued more than 40 years ago. Site-wide detections are primarily limited to shallow soil.

Site-Wide

Site-wide (that is, not including samples collected in the northwestern and fenced enclosure areas – see Figure 5 for designation of these two areas), TPHd concentrations ranged from less than laboratory reporting limits to 1,600 mg/kg. The highest TPHd concentrations were detected in samples from borings SRB-21 (1,600 mg/kg), SRB-36 (430 mg/kg), and SRB-40 (990 mg/kg). Borings SRB-21 and SRB-36 are located near a former oil trap near the western site boundary; boring SRB-40 is located south of the oil trap and near the location where discolored surface soil was observed by Geomatrix in 1992. The highest TPHd concentrations in SRB-36 and SRB-40 were detected only in shallow soil (within 1 foot bgs). The highest TPHd concentration in boring SRB-21 was detected in the sample collected at 7 feet bgs

(Figure 9). At this location, TPHd concentrations decreased with depth and were not detected above the laboratory reporting limit in the sample from 13.5 feet bgs.

Northwestern Area

In the northwestern area of the site, the highest concentrations of TPHd were detected in soil samples from the pipeline excavation and near the former 3000-bbl AST. Along the pipeline alignment (Figure 9), TPHd was detected in the uppermost samples (that is, within 0.5 foot bgs) at concentrations ranging between non-detect (PL-09) and 4,400 mg/kg (PL-12). In the 1-foot sample from PL-12L, TPHd was detected at a concentration of 16,000 mg/kg. Deeper samples collected along the alignment indicated that concentrations generally decreased with depth, except at boring location PL-12, where TPHd was detected in the 3-foot sample at a concentration of 1,100 mg/kg; the 5-foot sample from PL-12L contained TPHd at a concentration of 3,700 mg/kg.

Also in the northwestern area, selected soil samples were collected from borings where visually impacted soil was observed; the borings and sample depths are presented on Table 6. Boring locations and analytical results are shown on Figure 9. The analytical results indicated that samples collected above and below the visually impacted soil generally contained relatively lower concentrations of TPHd, where detected. Within the area of visual impact, TPHd concentrations ranged up to 16,000 mg/kg (SRB-100L located near the former 3000-bbl AST). Other elevated concentration samples (that is, above 1,000 mg/kg for the purpose of this discussion) were SRB-51 at 19.5 feet bgs (8,500 mg/kg), SRB-75 at 18.5 feet bgs (1,200 mg/kg), SRB-88L at 8 feet bgs (1,400 mg/kg), SRB-99 at 19.5 feet bgs (1,300 mg/kg), and SRB-100 at 7 feet bgs (1,800 mg/kg). However, in other borings located in the northwestern area of the site, TPHd concentrations generally were lower; TPHd concentrations in samples collected from other borings within visually impacted soil (SRB-53L, SRB-79L, SRB-80, SRB-81, SRB-83, SRB-88, SRB-90, SRB-91, and SRB-93) ranged between non-detectable to 350 mg/kg.

The analytical results suggest that the areas of the pipeline and the former 3000-bbl AST may have been potential source areas for petroleum in soil.

Fenced Enclosure

Within the fenced enclosure, the highest concentration of TPHd was detected in shallow soil samples collected from beneath the former storage trailer (SRB-70 at 1200 mg/kg in the sample collected at 0.5 foot bgs; Figure 9) and AST (SRB-96 at 2,700 mg/kg in the sample collected

from 0.5 foot bgs and SRB-73 at 440 mg/kg in the sample collected from 3 feet bgs). In SRB-70 and SRB-73, concentrations of TPHd decreased by an order of magnitude or more in the next deeper sample; no TPHd was detected above the laboratory detection limits of 1 mg/kg in the two deeper soil samples from SRB-96.

Total petroleum hydrocarbons characterized as motor oil

Site-Wide

Site-wide, TPHmo concentrations ranged from less than the laboratory reporting limit to 1,700 mg/kg (boring location SRB-40). Similar to TPHd, TPHmo is generally degraded, as shown by laboratory chromatograms, and is present in shallow soil. The highest TPHmo concentrations were detected in the shallow soil samples (within approximately 1 foot bgs) near the former oil trap from borings SRB-21 (510 mg/kg) and SRB-36 (780 mg/kg), and near the location of discolored soil at SRB-40 (1,700 mg/kg). Additionally, an elevated concentration of TPHmo was detected in a composite sample from SRB-20, which is in the southwestern area of the site near a former rail spur; however, the magnitude of this concentration could not be replicated in discrete samples from this location.

Northwestern Area

The distribution of TPHmo in the northwestern area of the site is similar to that of TPHd. The maximum concentrations of TPHmo detected in visually impacted soil sample were 7,600 mg/kg from SRB-51 at 19.5 feet bgs, 5,100 mg/kg from SRB-100 at 7 feet bgs, and 15,000 mg/kg from SRB-100L at 8 feet bgs. TPHmo generally was absent or present at low concentrations in soil samples collected from above and below the visually impacted areas. Along the pipeline, elevated concentrations of TPHmo generally were present in the shallowest samples (0.5 and 1 foot bgs), except at PL-01, PL-06, PL-12, and PL-12L.

Fenced Enclosure

Within the fenced enclosure, the distribution of TPHmo also is similar to that of TPHd. The highest concentrations of TPHmo (5,600 mg/kg and 3,300 mg/kg) were detected in shallow soil beneath the former storage trailer (boring SRB-70 in the sample collected from 0.5 foot bgs) and AST (boring SRB-96 in the sample collected from 0.5 foot bgs), respectively. At boring location SRB-70, the concentration of TPHmo decreased to 500 mg/kg in the sample collected at 3 feet bgs and was not detected above the laboratory detection limit of 50 mg/kg in the 5-foot sample at this location. At SRB-96, no TPHmo was detected in the 3- ad 5-foot samples. TPHmo also was detected at a concentration of 700 mg/kg in the 1-foot soil sample from

SRB-39. The concentration of TPHmo decreased in the 4.5-foot soil sample from SRB-39 to 51 mg/kg.

5.2.3 Polynuclear Aromatic Hydrocarbons

The analytical results for PAHs are summarized on Table 7.

Site-Wide

Site-wide PAHs have been detected only in samples from boring SRB-21 and SRB-32. At these locations, the detected PAH concentrations are well below their respective residential and industrial PRGs, except for benzo(a)pyrene, benzo(b)flouranthene, and indeno(1,2,3-cd)pyrene in the 1-foot sample from SRB-32 (Table 7). Benzo(a)pyrene was detected in the SRB-32 soil sample at a concentration of 0.526 mg/kg; this sample also contained 0.582 mg/kg benzo(b)fluoranthene and 0.455 mg/kg indeno(1,2,3-cd)pyrene. These detections are above the residential PRGs for these constituents. However, only the concentration of benzo(a)pyrene in this sample was above its industrial PRG of 0.13 mg/kg. No PAHs were detected in the soil sample from 4.5 feet bgs in boring SRB-32.

Site-wide no PAHs were detected above their respective SSL_{20}. The concentrations of certain PAHs in some samples collected in the upper foot are above the SSL_1; however, deeper samples collected at these locations do not contain PAHs at concentrations above this more conservative SSL, indicating that PAHs are relatively insoluble and immobile at the site.

Northwestern Area

Within the northwestern area of the site, PAHs, where detected, were at concentrations well below their respective PRGs, with the exception of several samples along and near the pipeline alignment. Specifically, certain PAHs were detected in samples from SRB-51, PL-03, PL-12 and PL-12L above their residential PRGs (Table 7). However, no PAHs were detected above their industrial PRGs except for benzo(a)pyrene and benzo(a)anthracene in the 0.5 foot sample from PL-12 and benzo(a)pyrene in the 3 foot sample at this same location. Benzo(a)pyrene was detected at a concentration of 4 mg/kg and benzo(a)anthracene was detected at a concentration of 4.8 mg/kg in the shallow soil sample from PL-12; the industrial PRGs for these PAHs are 0.13 and 1.3 mg/kg, respectively. The concentration of benzo(a)pyrene in the 3-foot sample from PL-12 was 0.29 mg/kg.

Within the northwestern area of the site, no PAHs were detected above their respective SSL_{20}, with the exception of benzo(a)anthracene in the sample collected from PL-12 at 0.5 foot bgs.

In this sample, benzo(a)anthracene was detected at a concentration of 4.8 mg/kg (the SSL_{20} is 2 mg/kg); however, no benzo(a)anthracene was detected in the samples collected at 1.5 and 3 feet at this location. These results indicate that PAHs are not mobilized in the subsurface. Additionally, although some shallow samples (within 1 foot bgs) contained PAHs above their respective SSLs, assuming a DAF of 1, no samples from below 1 foot bgs contained PAHs above the more conservative SSL_1. These results reinforce that PAHs are relatively insoluble and immobile.

Fenced Enclosure

Within the fenced enclosure, PAHs were detected only in the 1.5-foot sample from boring SRB-27. In this sample, none of the detected PAHs were present at concentrations greater than their respective residential PRGs. Additionally, none of the detected PAH concentrations exceeded the SSLs. No PAHs were present in the deeper sample (4.5 feet bgs) at boring SRB-27.

5.2.4 Volatile Organic Compounds

Soil samples have been primarily analyzed for BTEX and MTBE; selected soil samples also have been analyzed for CVOCs. No benzene, MTBE, or CVOCs have been detected in any of the soil samples analyzed. Ethylbenzene was detected in one sample only, in the surface soil sample from depths of 1 and 2 feet bgs at boring SRB-75 (in the northwestern area) at a concentration of 0.011 mg/kg. No ethylbenzene was detected in the deeper sample from this location. Xylenes also were detected in two soil samples from SRB-75 at a maximum concentration of 0.051 mg/kg (from the sample collected at 1 foot bgs). No xylenes were detected in the 5-foot sample from this location. Toluene, where detected, is present at low concentrations; specifically, detections of toluene range up to 0.042 mg/kg (SRB-100). The concentrations of detected constituents are well below their respective screening criteria (Table 8).

5.2.5 Results of Leachability Testing

The results of leachability testing are presented in Table 9. These tests were performed using the WET procedure (Sections 3.3 and 4.1) modified to use deionized water as the extract. As indicated by the results, no TPHmo, or PAHs leached from the soil matrix using the WET procedure for samples analyzed using silica gel cleanup[4]; silica gel cleanup removes non-

[4] The leachability tests for TPH and PAHs from samples SRB-36 and SRB-32, respectively, were performed one day beyond their hold times.

hydrocarbons that would otherwise interfere with measurement of petroleum hydrocarbons. TPHd results indicated that this constituent leached from soil under the conditions of the WET procedure at concentrations up to 690 µg/l (for the 1-foot sample PL-12L with a TPHd concentration of 16,000 mg/kg). As previously discussed, the WET procedure is aggressive compared to in situ conditions, as it involves shaking a sample within the extract for 48 hours. The WET results for TPHd, TPHmo, and PAHs suggest that these constituents have limited, if any, solubility under in situ conditions.

5.3 GROUNDWATER ANALYTICAL RESULTS

5.3.1 Grab Groundwater Analytical Results

As discussed in Section 3.4, grab groundwater sampling was used at the site to provide initial information on the possible presence of chemical constituents in groundwater. Samples that are collected using this methodology (described in Appendix A) generally provide conservative data that are used for screening purposes; these results can be further evaluated using monitoring wells, which provide longer-term, replicable data. Analytical results from monitoring wells that were installed at the site in 2001 are presented in Section 5.3.2. Results from grab groundwater sampling are discussed below by class of constituents.

Petroleum Hydrocarbons

Analytical results for petroleum hydrocarbons analyses for grab groundwater samples collected by Geomatrix are summarized in Table 10. Analytical results from the grab groundwater samples collected by IC are presented in Table 3. Grab groundwater samples collected upgradient of the property boundary (SRB-58 through SRB-61), within the fenced enclosure (SRB-62) and in the vicinity of the former 10,000-gallon gasoline UST (SRB-55) were analyzed for TPHg. No TPHg was detected in any of these samples.

Analysis for TPHd and TPHmo was conducted on both filtered and unfiltered samples for selected samples. Studies have shown that non-dissolved petroleum that adheres to sediment entrained in grab groundwater samples may be a source of bias with TPHd, TPHmo, and other extractable petroleum hydrocarbon analyses (MADEP, 2001). Such sediment commonly is present in grab groundwater samples collected from borings located in areas where petroleum hydrocarbons may be present in soil (Foote, et al, 1998). Although the results for both filtered

and unfiltered samples are discussed herein, analytical results from filtered grab groundwater samples may be more representative of the actual presence of dissolved-phase constituents in groundwater. The results for both unfiltered and filtered samples are presented in Table 10.

Site-Wide

Site-wide, petroleum hydrocarbons have only been detected in the grab groundwater sample from boring SRB-36. This boring is located near a former oil trap on the west-central site boundary. At this location, TPHd was detected in the unfiltered sample at a concentration of 67 µg/l; however, TPHd was not detected in the duplicate sample from this location or in the filtered sample. No TPHmo was detected in the grab groundwater sample from this location.

Northwestern Area

Within the northwestern area of the site, grab groundwater samples were collected from 10 borings. Of these, TPHd was detected in grab groundwater samples from five borings: SRB-34, SRB-44, SRB-48, SRB-75, and SRB-77. These samples were collected in areas where visually impacted soil is present; analytical results indicate that petroleum hydrocarbons are present at varying concentrations within the visually impacted soil. The highest concentrations of TPHd in unfiltered samples were detected in borings SRB-44, SRB-48, SRB-75, and SRB-77 at concentrations of 13,000 µg/l, 46,000 µg/l, 4,100 µg/l, and 950 µg/l, respectively. The concentrations of TPHd detected in the unfiltered samples from borings SRB-44 and SRB-48 are greater than the solubility of fresh diesel in groundwater, which ranges approximately between 2,000 µg/l and 6,000 µg/l (CMDEP, 1996). Significantly lower concentrations of TPHd were reported for filtered samples, with a maximum concentration of 1,500 µg/l in SRB-48. The results from the filtered samples suggest groundwater impact from TPHd within the area where visually impacted soil is present.

Analytical results for TPHmo are similar to those for TPHd in that maximum concentrations were detected in samples from borings SRB-44 (12,000 µg/l), SRB-48 (38,000 µg/l), SRB-75 (3,900 µg/l), and SRB-77 (1,100 µg/l). Again, the reported results for the unfiltered samples indicated the presence of TPHmo above its solubility in water, which is approximately 1,000 µg/l (CMDEP, 1996), suggesting non-dissolved petroleum that adheres to sediment was present in the grab groundwater samples. Filtered samples contained significantly lower TPHmo concentrations (360 µg/l in SRB-44, 950 µg/l in SRB-48 and non-detect in both SRB-75 and

SRB-77) that likely are more representative of groundwater conditions within the area of impacted soil.[6]

Fenced Enclosure

Within the fenced enclosure, TPHd was detected near the former 230-gallon UST in the grab groundwater sample from boring IC-B6 at a concentration of 31,000 µg/l. Again, this concentration exceeds the solubility of diesel in water. Analysis of subsequent grab groundwater samples collected within the fenced enclosure from SRB-39 and SRB-74 did not replicate this result; no TPHd was detected in these samples.

Polynuclear Aromatic Hydrocarbons

No PAHs were detected in the grab groundwater samples.

Volatile Organic Compounds

Site-Wide

Site-wide, VOCs were not detected in the grab groundwater samples, except for acetone (known to be a common laboratory contaminant), which was detected in the grab groundwater sample from SRB-30, which is located immediately northwest of the fenced enclosure (Table 10 and Figure 5). No benzene or toluene were detected in any of the site-wide borings, and ethylbenzene and xylenes only were detected at low concentrations from grab groundwater samples collected from borings SRB-59 and SRB-60, located near the upgradient site boundary. MTBE was detected near the upgradient site boundary in borings SRB-58 (120 µg/l), SRB-59 (34 µg/l), SRB-60 (9.6 µg/l), and SRB-61 (6.5 µg/l). MTBE also was detected in boring SRB-55, which is located near the former 10,000-gallon gasoline and diesel USTs (at a concentration of 2.8 µg/l).

Northwestern Area

BTEX was not detected in any of the 10 grab groundwater samples collected in the northwestern area of the site. MTBE was detected in this area at a maximum concentration of 3.3 µg/l in the grab groundwater sample from boring SRB-75.

[6] It should be noted that silica gel cleanup was conducted on both filtered and unfiltered samples from SRB-75, SRB-76 (unfiltered samples only), and SRB-77. Silica gel cleanup removes polar biogenic material, which otherwise is quantified in the petroleum hydrocarbon analysis. No TPHd or TPHmo were quantified in samples from these borings once the non-petroleum material was removed.

Fenced Enclosure

Only MTBE was detected above the laboratory detection limit in grab groundwater samples collected within the fenced enclosure. Concentrations of MTBE ranged between 9.8 µg/l in the grab groundwater sample from boring SRB-39 to 77 µg/l in SRB-42. SRB-42 is located at the eastern boundary of the fenced enclosure, and is relatively downgradient from the MTBE impact to groundwater previously identified along the eastern, upgradient site perimeter.

5.3.2 Monitoring Well Analytical Results

Monitoring well analytical results are presented on Tables 3 and 4. Historically, TPHd was detected at a concentration of 400 µg/l in the sample from well RBMW-2 in a sampling event by the RWQCB in 1990. Additionally, tetrachloroethene (PCE) was detected in this well at a concentration of 2.5 µg/l. PCE was not detected in the grab groundwater sample from boring SRB-31; this boring is adjacent to and downgradient of monitoring well RBMW-2 (Figure 5). No other detections of CVOCs, petroleum hydrocarbons, and petroleum-related constituents were reported in the samples from the RWQCB wells. Additionally, no petroleum hydrocarbons or related constituents were detected in groundwater samples from wells GW-24 and GW-27 during multiple monitoring events, except for one detection of benzene in a sample from monitoring well GW-27 in July 1989 (7 µg/l), and ethylbenzene in the sample from GW-24 in February 1990 (0.3 µg/l). PCE was detected at concentrations of 7.6 µg/l and 0.8 µg/l in groundwater samples from GW-24 and GW-27, respectively, in April 1988. No PCE was detected in a grab groundwater sample from borings SRB-20 and SRB-37, located near and approximately downgradient from wells GW-24 and GW-27 (Figure 5).

Four groundwater sampling events (December 2001; and March, June and September 2002) have been conducted from five monitoring wells installed by Geomatrix in September 2001. These wells are installed upgradient of the site (SRMW-07 and SRMW-08), downgradient of the northwestern area of the site (SRMW-05 and SRMW-06), and within the northwestern area of the site (SRMW-10). Overall, the groundwater monitoring data has been consistent over the monitoring events conducted to date. Analytical results indicate that only MTBE has been detected in the upgradient monitoring wells, at a maximum concentration of 11 µg/l. A one-time detection of TPHd also was reported in a groundwater sample from upgradient well SRMW-07 in June 2002; however, this detection is considered non-detect given the detection

of TPHd in an equipment blank during that particular sampling event,[7] and the result was not replicated in the subsequent sampling event.

6.0 DISCUSSION OF SITE CONDITIONS

The investigative results for constituents detected at the site have been compared to published criteria, where applicable; these criteria serve as a benchmark to initially evaluate the data and identify potential constituents of concern. Based on the initial evaluation of data, we have drawn the conclusions discussed below.

Within the site, chemical constituents primarily have been detected at discrete locations. Metals, where detected, are present generally at low concentrations that do not pose a risk to human health based on comparison to PRGs and expected background concentrations (discussed in Section 5.1), with the exception of arsenic, as discussed below. Similarly, PAHs, where detected, generally are present at concentrations that do not pose a risk to human health or a long-term risk of impact to groundwater (as supported by their general absence in deeper soil and groundwater), with the exception of PAHs along the former pipeline alignment. Varying concentrations of petroleum hydrocarbons in soil have been detected across the site; impact to groundwater from petroleum hydrocarbons is limited. Based on the investigative results, the following COCs and environmental conditions at the site have been identified:

- MTBE in groundwater;
- Arsenic in soil in the west-central area;
- Petroleum hydrocarbons in soil within the fenced enclosure; and,
- Petroleum hydrocarbons and PAHs in soil, and petroleum hydrocarbons in groundwater in the northwestern area.

A site conceptual model is presented and each of these conditions is discussed below.

6.1 CONCEPTUAL SITE MODEL

A conceptual site model (model) has been developed to assist with evaluating the identified environmental conditions at the site. This model is illustrated on Figure 10. The model illustrates the various potential sources of environmental impact that have been investigated at the site, our understanding of subsurface utilities, and the generalized geology and

[7] Based on the U.S. EPA Contract Laboratory National Data Validation Guidelines for Organic Data Review (U.S. EPA, 1994).

hydrogeology at the site. A detailed cross-section that illustrates subsurface conditions and the locations of grab groundwater and monitoring well sampling locations is presented as Figure 11. The conceptual site model in conjunction with the detailed site cross-section illustrates the following items that are pertinent to the discussion of the identified COCs and environmental conditions:

- Groundwater flow direction is to the west and southwest.
- Depth to groundwater fluctuates between approximately 8 and 17 feet btc within the northwestern area, as measured in monitoring wells, SRMW-05, SRMW-06, and SRMW-10 (approximate elevations of 141 to 132 feet msl; Table 1).
- Visually impacted soil that contains petroleum hydrocarbons is present within the zone of groundwater fluctuation (Table 11 and Figure 11).
- A City of Santa Rosa sanitary sewer line traverses the site north-south. Within the northwestern area of the site, the approximate invert elevation of the pipe is 144 feet msl, above the highest water level elevation, as measured in the monitoring wells, in the northwestern area.
- A City of Santa Rosa storm sewer line traverses east-west in the northwestern area and discharges into Santa Rosa Creek. The depth of the line is not known, and likely is below the groundwater surface during some times of the year.
- An inactive water-producing well is located on the property to the west of the site. The depth of the well and the interval from which it pumps, when operating, is not known; however, this well will be destroyed during the upcoming property redevelopment (Section 2.3.4).

6.2 MTBE IN GROUNDWATER

The results of sampling to evaluate the presence of MTBE in groundwater indicate that concentrations of MTBE are highest in borings located to the east of the site boundary (upgradient) and decrease across the site. Additionally, MTBE has not been detected in soil samples collected within the fenced enclosure (a potential source area based on the apparent handling of gasoline in this area) or at significant concentration in the grab groundwater samples collected near the former 10,000-gallon gasoline UST. These results indicate that a source of MTBE does not exist on site and that MTBE is migrating onto the site from an upgradient, off-site source. As discussed in Section 2.3.5, a fuel release has occurred at a location upgradient of the site (Ochipinti Gas Station located at 210 5th Street). We understand that the distribution of fuel-related constituents in groundwater from this release, including

MTBE is not fully defined. It is likely that this fuel release is the source of MTBE in groundwater beneath the site.

6.3 ARSENIC IN SOIL

Concentrations of arsenic detected in soil at the site are consistent and appear to be background (Section 5.2.1), with the exception of arsenic concentrations detected in soil samples from borings SRB-40 and SRB-41. As discussed in Section 5.2.1, concentrations of arsenic at the site, including the detections at borings SRB-40 and SRB-41, are primarily below the non-cancer residential PRG, and within the U.S. EPA's acceptable cancer risk range. However, the elevated concentrations of arsenic specific to SRB-40 and SRB-41 likely represent a localized impact from historical operations at the nearby oil trap at these locations.

6.4 PETROLEUM HYDROCARBONS IN SOIL IN THE FENCED ENCLOSURE

TPHd and TPHmo have been detected within the fenced enclosure in shallow soil (upper 3 feet) primarily near the former storage trailer, and within the upper 1 foot near the former AST. Only low to non-detectable concentrations of TPHd and TPHmo are present in deeper samples. No aromatic constituents (e.g., benzene) were detected. PAHs, where detected, were present at concentrations below their respective PRGs, except for the PAH detections in the 1-foot sample at SRB-32; no PAHs were detected in the deeper sample at this location. The presence of TPHd and TPHmo in shallow soil appears to be due to incidental surface spillage and is limited in vertical extent. TPHd and TPHmo were not detected in grab groundwater samples collected from within the fenced enclosure, except for the detection of TPHd reported in the sample from IC-B6; this detection was not replicated in additional grab groundwater samples collected near IC-B6. Based on the results, discrete impacts to shallow soil have occurred as a result of operations within the fenced enclosure.

6.5 PETROLEUM HYDROCARBONS AND PAHS IN SOIL, AND PETROLEUM HYDROCARBONS IN GROUNDWATER IN THE NORTHWESTERN AREA

6.5.1 Soil

Field observations and analytical results indicate that soil that contains petroleum hydrocarbons is present at depth and below the water table within the northwestern area of the site (Figures 8, 9 and 11; Tables 6 and 11). The detections of petroleum hydrocarbons within visually

impacted soil[8] are variable; concentrations detected near the former location of the 3000-bbl AST ranged between 120 mg/kg to 16,000 mg/kg for TPHd and 130 mg/kg to 15,000 mg/kg for TPHmo. Near the former oil pipeline, concentrations of TPHd and TPHmo in soil samples ranged up to 16,000 mg/kg and 22,000 mg/kg, respectively. The depth of the petroleum-containing soil is defined at only some locations in the pipeline alignment.

The former pipeline appears to be a source area based on the concentrations and distribution of petroleum hydrocarbons and PAHs along its alignment. An additional potential source area appears to be near and north of the former 3000-bbl AST, based on results from SRB-100 and SRB-100L. The absence of aromatic constituents (e.g., benzene) in the soil samples, low concentrations of PAHs, where detected, and the generally degraded nature of the detected TPHd and TPHmo, as demonstrated by the laboratory chromatograms, is consistent with a release of diesel- and/or oil-range petroleum product to the site many years ago.

6.5.2 Groundwater

The results of grab groundwater samples indicate that only localized impact to groundwater has occurred (based on the results of filtered grab groundwater samples, which provide a better representation of actual groundwater impacts relative to unfiltered grab groundwater samples [Section 5.3]). Specifically, localized areas of impact identified within the northwestern area include: 1) near the western site boundary, as defined by SRB-48; and, 2) near the former 3000 bbl AST, as defined primarily by SRB-44.[9] The localized nature of the groundwater impacts is supported by data from other grab groundwater samples and monitoring well samples. Approximately downgradient and within 40 feet of SRB-44, no TPHd or TPHmo were detected in the grab groundwater sample from SRB-47. *No TPHd or TPHmo has been detected in SRMW-05, located within 20 feet downgradient of petroleum-impacted soil, or in SRMW-10, which is located near, but possibly not directly downgradient, of impacted soil.*

The potential long-term leachability of petroleum to soil was evaluated using the WET procedure. The results indicated that low concentrations of TPHd could leach from soil with high concentrations of TPHd under the aggressive conditions imposed by the test. No TPHmo was detected in the WET extracts.

---

[8] Visually impacted soil is present at two locations over a total area of approximately 9,400 square feet, and is present below the water table, which has been measured at depths ranging from approximately 8 to 17 feet bgs in monitoring wells in the northwestern. At most boring location, visually impacted soil was not encountered until at least 10 feet bgs.

[9] TPHd also was detected in samples from SRB-75 and SRB-77; however, no TPHd was detected in filtered samples that were prepared with a silica gel cleanup prior to analysis.

No active water-producing wells that likely would hydraulically influence the site are present in the nearby vicinity (that is, within 1000 feet of the site; Figure 4). As shown on the site conceptual model, an inactive well reportedly exists west (and downgradient) of the site; construction details of this well are not known. However, this well will be destroyed during redevelopment of the property (personal communication between N. Jellison, NWPRA and John Stewart of John Stewart Company).

Also downgradient of the site, Santa Rosa Creek is identified as a potential receptor. It appears unlikely that site utilities would serve as preferential pathways for dissolved constituents in groundwater to the Creek or other off-site locations. The sanitary sewer line that traverses the site north-south is located east (upgradient) of the area of impacted soil and is buried at a depth above the seasonal groundwater table. The storm sewer line traverses east-west near some boring locations where impacted soil was observed and near monitoring well SRMW-05. The depth of the storm sewer in this area is not specifically known and likely is below the groundwater surface, at least at some times of the year. As such, the storm sewer line could be a conduit for dissolved constituents in groundwater. However, data from well SRMW-05 suggest that dissolved-phase petroleum is not present at detectable concentrations near the storm drain. Data from this well over a year of monitoring indicate that groundwater is not impacted. Given the absence of dissolved constituents, it is reasonable to conclude that the storm drain does not act as a preferential pathway, even if it is below the groundwater surface during times of the year.

6.6 SUMMARY AND CONCLUSIONS

In summary, MTBE has been detected at low concentrations beneath the site and appears to originate from an off-site source. Therefore, MTBE is not a COC for the site. The soil and groundwater data indicate that impacts to soil and localized impact to groundwater have been detected on site. These impacts are from arsenic, TPHd, TPHmo, and PAHs, which are identified as COCs for the site. Specifically,

- arsenic has been detected at concentrations exceeding background in a localized area (borings SRB-40 and SRB-41);
- discrete TPHd and TPHmo impacts have occurred to shallow soil within the fenced enclosure;
- elevated concentrations of TPHd and TPHmo have been detected in shallow soil beneath the former pipeline alignment and some PAHs are present above their respective PRGs;

- TPHd and TPHmo are present in soil in the northwestern area; and
- TPHd and TPHmo have been detected in grab groundwater samples collected in the area where soil containing petroleum hydrocarbons is present. These constituents are not present in groundwater within 20 feet of the petroleum-impacted soil.

Degraded TPHd and TPHmo, such as that found at the site, are relatively immobile in the environment as demonstrated by the localized impact of TPHd and TPHmo to groundwater within the area of impacted soil, and leachability testing results. Therefore, it is not expected Santa Rosa Creek (located approximately 150 to 200 feet downgradient of the site), would be affected by TPHd and TPHmo detected on site.

7.0 SITE-SPECIFIC REMEDIAL ACTION OBJECTIVES

This section provides a basis for establishing a remedial action for the site based on the development and application of appropriate site-specific remedial action objectives for the identified COCs, which include arsenic, TPHd, TPHmo, and PAHs. In general, the goals for the remedial action are to provide long-term protection of human health, the environment, and beneficial uses of waters of the State in a cost-effective manner. The protection of human health, the environment, and the beneficial uses of waters of the State at the site can best be achieved by:

- Maintaining beneficial uses of groundwater;
- Maintaining site conditions that prevent migration of constituents from soil to groundwater at concentrations exceeding appropriate water quality objectives; and,
- Preventing exposure to constituents in soil above health-based criteria.

These criteria are discussed below relative to applicable regulations and development of remedial action objectives.

7.1 MAINTAINING BENEFICIAL USES OF GROUNDWATER

The highest potential beneficial use of groundwater at the site, as established in the Water Quality Control Plan for the North Coast Region (referred to as the Basin Plan, RWQCB, 2001), is domestic and municipal water supply. As required by State law, the RWQCB has established water quality objectives "which, in the Regional Water Board's judgment, are necessary for the reasonable protection of the beneficial uses and for the prevention of nuisance." (RWQCB, 2001). Based on conversations with the RWQCB, the water quality

objectives for TPHd and TPHmo in groundwater are 100 µg/l and 175 µg/l, respectively. These water quality objectives are achieved within 20 feet of the petroleum-impacted soil. However, the RWQCB has requested that these objectives be achieved on site. Therefore, remedial action at the site will be conducted with the goal of achieving these water quality objectives.

7.2 MAINTAINING SITE CONDITIONS THAT PREVENT MIGRATION OF CONSTITUENTS FROM SOIL TO GROUNDWATER AT CONCENTRATIONS EXCEEDING APPROPRIATE WATER QUALITY OBJECTIVES

As discussed in Sections 5.0 and 6.0, TPHd and TPHmo are present in surface and deeper soil at the site; PAHs have been detected at some locations where petroleum hydrocarbons are present. Based on the results of the investigations and known chemical properties, the degraded TPHd and TPHmo, which are primarily depleted of aromatic and PAH constituents, are not considered to be highly mobile, and no widespread impact to groundwater beneath the site exists as demonstrated by groundwater monitoring data, or is reasonably anticipated from petroleum hydrocarbons in soil at the site. However, as stated by the RWQCB in its April 16, 2001 letter to UPRR, the Basin Plan (RWQCB, 2001) calls for "The elimination of pollutant sources through...removal of contaminated soil to the extent practicable is the Regional Water Board's highest priority." This policy is articulated in the RWQCB's Resolution 93-59,[10] which is incorporated into the Basin Plan and was referenced in the April 2001 letter. This resolution further states that removal of contaminated soil to the extent practicable "will be based on impacts on the beneficial uses of affected waters as determined by reasonable monitoring or other investigation" and that, as practicable, the RWQCB will recognize the use of alternative cleanup techniques, such as in-situ bioremediation and passive remediation.

Monitoring over four quarters at the site suggests no impacts to groundwater from petroleum hydrocarbons above the water quality objectives established by the RWQCB. However, filtered grab groundwater samples suggest that localized impacts by TPHd and TPHmo may have occurred; no PAHs have been detected in grab groundwater samples. To mitigate these localized impacts, a remedial action could be designed for soil containing petroleum hydrocarbons (TPHd and TPHmo) that considers the results of the leachability testing (Section 5.2.5 and Table 9).

[10] Resolution 93-59 amending the Water Quality Control Plan for the North Coast Region to Include *an Interim Policy on the Regulation of Waste Discharges from Underground Petroleum Tank Systems.*

Results of the leachability testing are presented in Table 9. The post-extraction solutions were analyzed for TPHd and TPHmo. No TPHmo were detected (2000 and 2002 samples). Three of fourteen samples from 2002 had detections of TPHd in the post-extraction solution; there were no detections of TPHd in the 2000 extracts.[11] Two of the three detections exceeded the water quality objective of 100 µg/l for TPHd.

The results of this leachability testing can be used to make a conservative estimate of the threshold total TPHd concentrations that might produce exceedance of the water quality objective. This threshold would represent a cleanup standard for soil. The estimate by this method is conservative because the results of the modified WET tend to overestimate the concentration of TPHd that would occur in water that contacts the TPHd. As previously discussed in Section 3.3, the WET uses a fixed volume of water and disrupts the soil structure such that equilibrium partitioning will be achieved among the aqueous and non-aqueous phases present. Whereas, insitu, water migrates past the TPHd without disrupting the soil structure and without achieving equilibrium partitioning in the bulk of the water.

Using the results of leachability testing in 2002, we have estimated the threshold TPHd concentration by linear regression (Anderson, 1927). We performed a least-squares linear regression of total TPHd on WET TPHd with the regression line passing through the origin (Figure 12). For values reported as less than the detection limit, we substituted the detection limit (50 µg/l). We calculated upper and lower 95 percent confidence limits for the regression line. For the threshold concentration we used the lower confidence limit for total TPHd at a WET TPHd concentration of 100 µg/l, which was 1060 mg/kg.

As stated above, there were no detections of TPHmo in the WET extract. The maximum TPHmo concentration detected in the soil samples that underwent the WET procedure was 22,000 mg/kg. As indicated by the analytical results, higher concentrations of TPHmo generally were detected in the same samples that the higher TPHd concentrations were detected. Therefore, it is reasonable to assign the same threshold concentration for TPHd and TPHmo.

[11] For samples tested in 2002, these results are for post-extraction solutions prepared using EPA Method 3630, a silica gel cleanup. The Method 3630 removes non-hydrocarbons that would otherwise interfere with measurement of petroleum hydrocarbons using EPA Method 8015M.

Based on the above discussion, a remedial action at the site will be conducted to comply with the Basin Plan and Resolution 93-59 considering the threshold TPHd concentration calculated above, and assigning the same threshold TPHd concentration to TPHmo.

7.3 LONG-TERM PROTECTION OF HUMAN HEALTH

A comparison of specific constituents to residential and industrial PRGs was conducted as a screening-level health risk evaluation. Without a site-specific human health risk assessment, these screening criteria can be used as a remedial action objective, except for arsenic. As discussed in Section 5.2, metals in soil are naturally-occurring, and typical background concentrations for arsenic, an identified COC, are greater than their residential and industrial PRGs. Concentrations of arsenic at the site generally range up to approximately 8 mg/kg, which are consistent with published background concentrations (Section 5.2.1). Therefore, long-term protection of human health will be achieved at the site when constituent concentrations are less than residential PRGs and for arsenic, are less than background.

7.4 REMEDIAL ACTION OBJECTIVES

Based on the discussion presented above, the remedial action at the site will be designed to: 1) achieve water quality objectives on site, as set forth by the RWQCB; 2) comply with the Basin Plan and Resolution 93-59 considering the threshold TPHd and TPHmo concentration of 1060 mg/kg (Section 7.2); and long-term protection of human health using residential PRGs or background concentrations, as appropriate.

8.0 PROPOSED REMEDIAL ALTERNATIVE

The proposed remedial alternative was designed to address soil in the vadose (unsaturated) zone that contains TPHd and TPHmo above the threshold concentration of 1060 mg/kg, PAHs above residential PRGs, and arsenic above background concentrations.

The thickness of the vadose zone was assumed based on the depths at which saturated deposits typically were encountered during drilling and the depths at which grab groundwater samples were collected. As discussed in Section 2.3.3, saturated deposits typically were encountered at depths between 7 and 14 feet bgs in borings drilled between November and June; in September 2000, saturated deposits were observed between 11 and 20 feet bgs. Grab groundwater samples in September 2002 generally were collected with the top of the temporary well screen at 17 feet bgs. Based on this information, it is assumed that the vadose zone could extend to 17 feet bgs at this drier time of year.

Based on the above and the remedial action objectives (Section 7.4) the proposed program consists of:

1. removing shallow soil (to a depth of 1-foot bgs) at the locations where TPHd and TPHmo were detected in the fenced enclosure above 1060 mg/kg (SRB-70, SRB-71, and SRB-96);

2. excavating soil to a depth of approximately 10 feet bgs at SRB-21 over an area of 25 square feet to remove TPHd;

3. excavating soil to a depth of approximately 2 feet bgs at boring location SRB-36 over an area of approximately 25 square feet;

4. excavating soil to a depth of approximately 8 feet bgs at borings SRB-40 and SRB-41 over an area of approximately 25 square feet each to remove arsenic at concentrations greater that background;

5. excavating soil to a depth of approximately 1 foot below groundwater surface (not to exceed a maximum depth of 17 feet bgs) over an area of approximately 100 square feet at SRB-51 and pumping groundwater out of the excavated area;

6. excavating soil to a depth of approximately 10 feet bgs at SRB-88L and SRB-100 over an area of approximately 100 square feet each to remove TPHd and TPHmo at concentrations over 1060 mg/kg;

7. excavating soil along the pipeline to a depth of at least 4 feet below the bottom of the pipeline trench (and a depth of 5 feet near PL-12) or until the threshold concentrations for TPHd and TPHmo are achieved (to a maximum depth of 1 foot below groundwater surface);

8. installing an additional groundwater monitoring well along the site's western boundary at a location approximately downgradient of grab groundwater sampling location SRB-44 and borings SRB-99 and SRB-100; and,

9. conducting quarterly groundwater monitoring for one year from the newly-installed and existing wells, and semi-annually groundwater monitoring for an additional two years.

The locations of the proposed actions are shown on Figure 13. Approximately 300 cubic yards of in- place soil would be excavated. Assuming that the density of the soil is about 130 pounds per cubic foot, this in-place volume represents more than 500 tons of soil requiring disposal at a Class II disposal facility.

Soil excavation will be conducted using a backhoe, as possible, excavation sidewalls will be vertical, either shoring or staggered excavation techniques will be used to assure the integrity of the excavations.

It is anticipated that groundwater will enter the excavation at boring SRB-51. Groundwater would be pumped into a polyethylene tank. Sediments in the water will be allowed to settle, and the groundwater will be sampled to evaluate appropriate disposal. Given the low concentrations of dissolved TPHd and TPHmo in groundwater, where detected, it is assumed that the extracted groundwater can be disposed in the City of Santa Rosa sanitary sewer line, which traverses the site, with no treatment other than filtering.

Backfilling would be accomplished using control density fill (CDF) up to 10 feet bgs; imported select fill would be placed and nominally compacted from 10 feet bgs to ground surface. Other, shallower excavations will be backfilled with imported, select fill.

Prior to backfilling, confirmation soil samples will be collected as follows:

- One soil sample will be collected at the bottom of the discrete, shallow excavations at SRB-70, SRB-71, and SRB-96 and analyzed for TPHd and TPHmo.
- One soil sample will be collected from the bottom of the shallow excavation at SRB-36 and analyzed for PAHs.
- A total of five soil samples will be collected at the excavation at boring SRB-21; one sample will be collected at the bottom of the excavation and one sample will be collected at each of the sidewalls at a depth of about 7 feet bgs (where the highest TPHd concentration was detected). These samples will be analyzed for TPHd.
- A total of five soil samples will be collected from each of the excavations at SRB-40 and SRB-41; one sample will be collected from the bottom of the excavation and a sample will be collected on each sidewall at a depth of about 7.5 feet bgs, where the highest arsenic concentrations were detected.
- A total of six soil samples will be collected from each of the excavations at borings SRB-51, SRB-88L, and SRB-100; two of these samples will be collected along the excavation bottom and one sample along each of the sidewalls at a depth of approximately 8 feet bgs in SRB-88L, 10 feet bgs in the SRB-51 excavation and 8 feet bgs in the SRB-100 excavation (where the highest TPHd and TPHmo concentrations were detected samples from these excavations will be analyzed for TPHd and TPHmo.

9.0 IMPLEMENTATION OF THE RECOMMENDED ALTERNATIVE

Following regulatory approval of the proposed remedial alternative, UPRR will proceed with its implementation, including excavation contractor selection, coordination of drillers, and permitting. It is anticipated that it will require approximately 12 weeks to plan and implement the work. A remedial action implementation report could be submitted to the RWQCB six weeks following completion of the program.

BORING SUMMARY TABLE

Santa Rosa Station Phased Closing Property
Santa Rosa, California

GEOMATRIX

Notes:

a. Geomatrix borings 29 and 30 (SRB-29 and SRB-30) were placed at locations that initially were thought to be directly at and southwest of former Industrial Compliance boring B-6 (ICB-6) and the 230-gallon UST. Upon further field review, it appeared that borings 29 and 30 were placed approximately northwest and downgradient of ICB-6. Geomatrix borings SRB-39 and SRB-74 subsequently was drilled adjacent to ICB-6.
b. Borings ICB-1 through ICB-4 and ICB-6 were drilled by Industrial Compliance in 1992 to evaluate the possible environmental impacts from former underground storage tanks.
c. Geomatrix borings SRB-39 and SRB-74 were drilled to replicate results from ICB-6 and were field-located with Ms. Joan Fleck of the RWQCB; these borings also are located immediately west of the abandoned aboveground tank within the fenced enclosure.

1. Borings SRB-20 through SRB-31 were advanced in November 1996 as part of the due diligence environmental characterization for the property transfer between Union Pacific Railroad Company (successor to Southern Pacific Railroad Company) and the Northwestern Pacific Railroad Authority.
2. Borings SRB-32 through SRB-41 were advanced in March 2000 in response to the August 1999 request from the Regional Water Quality Control Board, North Coast Region (RWQCB) for leachability testing, additional grab groundwater sampling, and evaluation of potential environmental impacts from the two on-site pump houses.
3. Borings SRB-42 through SRB-54 were advanced in August 2001 in response to the July 2000 request from the RWQCB to evaluate the source of MTBE, further characterize the area near the former 3000-barrel aboveground storage tank, and further evaluate the southern oil trap.
4. Monitoring wells SRMW-05 through SRMW-08 and SRMW-10 were installed in September 2001 in accordance with Geomatrix's January 2001 work plan, as amended in response to the RWQCB's April 2001 review comments.
5. Borings SRB-63 through SRB-103 and PL-01 through PL-12 were advanced in June through November 2002 in response to: 1) the April 2002 request from the RWQCB to evaluate the extent of visually-impacted soil in the vadose-zone in the northwestern portion of the site; 2) the June 2002 request from the RWQCB to evaluate the extent of visually-impacted soil in the vadose-zone in the vicinity of the former 3000-barrel aboveground storage tank; and 3) comply with requirements for the removal of underground pipelines.

Notes:

[1] PNAs detected in boring RBB-1 include naphthalene (2.08 mg/kg); 2-methylnaphthalene (1.15 mg/kg); acenaphthalene (1.45 mg/kg); dibenzofuran (1.13 mg/kg); fluorene (1.38 mg/kg); phenanthrene (3.86 mg/kg); anthracene (0.557 mg/kg), and benzo(a)anthracene (0.324 mg/kg).

[2] GW-24 and GW-27 were installed on behalf of Mead Clark. The analytical results for GW-24 and GW-27 show only the monitoring events in which constituents were detected. Six monitoring events have been performed (4/88, 6/88, 10/88, 1/89, 4/89, 7/89). Chlorinated volatile organic compounds (CVOCs) were tested for only in 4/88. Additional groundwater sampling was conducted at monitoring well GW-24 for TPHg and BTEX (2/90, 6/90, and 10/90).

Abbreviations:

TPHg = total petroleum hydrocarbons quantified as gasoline
TPHd = total petroleum hydrocarbons quantified as diesel
TPHmo = total petroleum hydrocarbons quantified as motor oil
TPHog = total petroleum hydrocarbons quantified as oil & grease
TPHk = total petroleum hydrocarbons quantified as kerosene
RWQCB = Regional Water Quality Control Board - North Coast Region
BTEX = benzene, toluene, ethylbenzene, and xylenes
PAHs = polynuclear aromatic hydrocarbons
CVOCs = chlorinated volatile organic compounds
feet bgs = feet below ground surface
NA = not available
ND = not detected above the laboratory detection limit
PCE = tetrachloroethene

Notes:

[1] Monitoring well groundwater samples collected by Geomatrix Consultants, Inc., and analyzed by Severn Trent Laboratories (STL) San Francisco of Pleasanton, California for benzene, toluene, ethylbenzene, and total xylenes (BTEX) and methyl tertiary butyl ether (MTBE) by U.S. EPA Method 8260; total petroleum hydrocarbons quantified as gas (TPHg), diesel (TPHd), and motor oil (TPHmo) by U.S. EPA Method 8015M; and polynuclear aromatic hydrocarbons (PAHs) by U.S. EPA Method 8270 SIM.

[2] Monitoring wells SRMW-05 and SRMW-06 are located west of the site on the Salvador Trust property, SRMW-07 and SRMW-08 are located east of the site on property owned by the NWPRA, and well MW-10 is located on the site.

[3] NA = not analyzed.

[4] "<" = not detected above the laboratory detection limit shown.

[5] "U" indicates compound was positively identified; the associated numerical value is less than five times the concentration detected in the field equipment blank and the result is considered non-detect.

[6] "<0.5/<0.5" = primary sample/duplicate sample

Notes:

[1] Samples collected by Geomatrix Consultants, Inc. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California. Samples collected in 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California. Metals analyzed in accordance with U.S. EPA Methods 6000/7000 series.

[2] Sampling depth measured in feet below ground surface. Depth listed represents the bottom depth of the sample interval (i.e. 4 equals a six inch sample collected from 3.5 - 4.0 feet below ground surface).

[3] "c" denotes composite sample.

[4] -- = Sample not analyzed for this metal.

[5] Residential and Industrial Preliminary Remediation Goals (PRGs) from U.S. EPA Region 9 (U.S. EPA 2000).

[6] The residential and industrial PRGs for arsenic at cancer risk levels of $1x10^{-6}$ to $1x10^{-4}$ range between 0.39 mg/kg and 39 mg/kg (residential), and 2.7 and 270 mg/kg (industrial), respectively. At $1x10^{-6}$ cancer risk, the PRG is less than background and therefore is not applicable.

[7] The industrial PRG for chromium (III) is used, as speciation of chromium in borings SRB 33-A, SRB 33-B, SRB-34A, and SRB 34-B did not indicate the presence of chromium (VI).

[8] STLC = Soluble Threshold Limit Concentration, California Code of Regulations, Title 22, Section 66216.24

[9] TTLC = Total Threshold Limit Concentration, California Code of Regulations, Title 22, Section 66216.24

Notes:

[1] Samples were collected by Geomatrix Consultants, Inc. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California for, TPHd and TPHmo using EPA Method 8015. Samples collected in March 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California, for TPHd and TPHmo using EPA Method 8015M following silica gel cleanup procedure by EPA Method 3630C. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd. of Berkeley, California for, TPHd and TPHmo using EPA Method 8015M following silica gel cleanup procedure by EPA Method 3630C. Samples collected in September 2001 were analyzed by Severn Trent Laboratories (STL) of Sacramento, California for TPHg, TPHd, and TPHmo using EPA Method 8015M. Samples collected in 2002 were analyzed by STL San Francisco of Pleasanton, California, for TPHg, TPHd, TPHmo, and Bunker-C fuel oil using EPA Method 8015M following silica gel cleanup procedures by EPA Method 3630C. Samples collected in November 2002 analyzed by Friedman and Bruya, Inc. of Seattle, Washington for TPHd and TPHmo using EPA Method 8015M following silica gel cleanup procedures by EPA Method 3630C.

[2] Sampling depth measured in feet below ground surface. Depth listed represents the bottom depth of the sample (i.e., 4 equals a six inch sample collected from 3.5 - 4.0 feet below ground surface).

[3] "c" denotes composite sample.

[4] -- = not analyzed.

[5] Lab sheet indicates that result is quantified as diesel; chromatographic pattern not typical of fuel.

[6] Additional analyses, total purgeable/total extractable petroleum hydrocarbons, performed for SRB-56-1.0, SRB-62-1.5, SRB-62-6.0. Results were SRB-62-1.0 = 330/8200; SRB-62-1.5 = <1.1/25, and SRB-62-6.0 = <1.2/97, respectively.

[7] 10/6.8 = Result without silica gel cleanup/result with silica gel cleanup.

Abbreviations:
TPHg = total petroleum hydrocarbons quantified as gasoline
TPHd = total petroleum hydrocarbons quantified as diesel
TPHmo = total petroleum hydrocarbons quantified as motor oil

TABLE 7

ANALYTICAL RESULTS FOR POLYNUCLEAR AROMATIC HYDROCARBONS (PAHs) IN SOIL[1]

Santa Rosa Station Phased Closing Property
Santa Rosa, California

Notes:

[1] All samples collected by Geomatrix Consultants, Inc. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California using EPA Method 8310. Samples collected in March 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California using EPA Method 8270SIM. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd., of Berkeley, California, using EPA Method 8270. Samples collected in 2002 analyzed by Severn Trent Laboratories (STL) San Francisco of Pleasanton, California using EPA Method 8270C SIM.

[2] Sample depth measured in feet below ground surface. Depth listed represents the bottom depth of the sample interval (i.e. 4 equals a six inch sample collected from 3.5 - 4.0 feet below ground surface).

[3] "c" denotes composite sample.

[4] -- = not analyzed.

[5] For carcinogenic PAHs (benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(a)pyrene, indeno-(1,2,3-cd)pyrene, and dibenzo(a,h)anthracene) California cancer slope factors were used to derive residential and industrial PRGs. For non-carcinogenic PAHs EPA Region 9 (EPA, 2002) PRGs are presented.

[6] Surrogate PRGs for a constituent with similar physical and chemical properties were used for the PRG comparison. Phenanthrene screening based screening based on fluorene as a surrogate, benzo(g,h,i) perylene screening based on fluoranthene as surrogate.

[7] Soil screening levels are from the EPA PRG document, and assume a dilution attenuation factor (DAF) of 1 and a DAF of 20.

Abbreviations:

PNAs = polynuclear aromatic hydrocarbons
PRGs = preliminary remediation goals
DAF = dilution attentuaion factor

Notes:

[1] All samples were collected by Geomatrix Consultants, Inc. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd. of Berkeley, California for benzene, toluene, ethylbenzene, and xylenes (BTEX) using EPA Method 8260B. Samples collected in September 2001 were analyzed by Severn Trent Laboratories (STL) of Sacramento, California, for MTBE using EPA Method 8260B. Samples analyzed for MTBE were collected in Encore Samplers and prepared for analysis by the laboratory in accordance with EPA Method 5035. Samples collected in 2002 were analyzed by STL San Francisco of Pleasanton, California using EPA MEthod 8260B. Samples analyzed for BTEX and MTBE were collected in Encore Samplers and prepared for analysis by the laboratory in accordance with EPA Method 5035.

[2] Sampling depth in feet below ground surface. Depth listed represents the bottom depth of the sample interval (i.e. 4 equals a six inch sample collected from 3.5 - 4.0 feet below ground surface).

[3] -- = not analyzed

[4] Sample intervals for samples collected in the pipeline area represent depth below pipeline.

Abbreviations:
MTBE = methyl tertiary butyl ether
PRGs = preliminary remediation goals
DAF = dilution attenuation factor
NA = not available

	11/14/02	5.0	3,700	2,400/180[8]	4,100	520/<100[8]	8.35	--

Notes:

1 Samples collected by Geomatrix Consultants, Inc. Samples collected in March 2000 were analyzed by Entech Analytical, Inc. of Sunnyvale, California. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd., of Berkeley, California.

2 Sampling depth in feet below ground surface. Depth listed represents the bottom depth of the sample interval (i.e. 1.0 equals a six inch sample collected from 0.5 – 1.0 feet below ground surface).

3 TPHd = total petroleum hydrocarbons as diesel; TPHmo = total petroleum hydrocarbons as motor oil. Samples analyzed by EPA Method 8015M followed by a silica gel cleanup by EPA Method 3630C.

4 WET = waste extraction test, waste extraction test was performed using simulated rainwater. Results are presented in micrograms per liter.

5 PNAs = polynuclear aromatic compounds. In March 2000, samples were analyzed by EPA Method 8270 SIM. In September 2000, samples were analyzed by EPA Method 8270.

6 The leachability tests for TPH and PNAs from samples SRB-36 and SRB-32, respectively, were performed one day beyond their hold times.

7 Lab sheet indicates that result is quantified as diesel but the chromatographic pattern is not typical of fuel.

8 1,300/<50 = result without silica gel cleanup / result with silica gel cleanup. The silica gel cleanup method removes non-hydrocarbons that would otherwise interfere with measurement of petroleum hydrocarbons. The data generated following silica gel cleanup is used for analysis of the leachability test results.

-- = not analyzed

Notes:

[1] Samples were collected by Geomatrix Consultants, Inc. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California; TPHd and TPHmo were analyzed using EPA Method 8015 following silica gel cleanup procedure EPA Method 3630C and VOCs were analyzed for using EPA Method 8240. Samples collected in March 2000 were analyzed by Entech Analytical, Inc. of Sunnyvale, California, and analyzed for TPHd and TPHmo using EPA Method 8015M following silica gel cleanup procedure per Method 3630C; PNAs using Method 8270SIM; and VOCs including MTBE and other fuel oxygenates using EPA Method 8260. Samples that were collected in March 2000 for TPHd, TPHmo, and PAHs were analyzed before and after passing through a 0.7 micron glass fiber filter. Samples collected in September 2000 were analyzed by Curtis and Tompkins, Ltd. of Berkeley, California, for TPHd and TPHm using EPA Method 8015M following silica gel cleanup procedure by EPA Method 3630M; for BTEX and MTBE using EPA Method 8260B; and for PAHs using EPA Method 8270C. Samples collected in September 2001 were analyzed by Severn Trent Laboratories (STL), of Sacramento, California, for TPHg, TPHd, TPHmo by EPA Method 8015M and for MTBE by EPA Method 8260B. Samples collected in 2002 analyzed by STL San Francisco of Pleasanton, California and analyzed for TPHg, TPHd, and TPHmo by EPA Method 8015M following a silica gel cleanup by EPA Method 3630 and for BTEX and MTBE by EPA Method 8260B.

[2] Results of sample/blind duplicate sample (labeled SRB46) are shown.

[3] Lab sheet indicates that result is quantified as diesel; chromatographic pattern not typical of fuel.

[4] A borehole identification number followed by "D" indicates that a blind duplicate sample was collected at this location.

[5] Detection limit for benzene, toluene, and ethylbenzene is 0.5 µg/l. Detection limit for xylenes is 1 µg/l.

[6] Samples were reanalyzed to quantify the dissolved concentrations of the chemicals listed. Analyses were performed by Friedman and Bruya, Inc., of Seattle, WA. Samples were passed through a 0.7 micron glass fiber filter and analyzed according to EPA method 8015M following silica gel cleanup procedure by EPA Method 3630. Extraction and reanalysis of samples SRB-44 and SRB-48 was performed on October 17, and 24, 2000, respectively.

Abbreviations:

TPHg = total petroleum hydrocarbons quantified as gasoline
TPHd = total petroleum hydrocarbons quantified as diesel
TPHmo = total petroleum hydrocarbons quantified as motor oil
f = filtered with 0.7 micron glass fiber filter
PAHs = polynuclear aromatic hydrocarbons
NS = not specified
MTBE = methyl tertiary butyl ether
BTEX = benzene, toluene, ethylbenzene, and xylenes
VOCs = volatile organic compounds
ND = not detected above laboratory reporting limits (for VOCs: 5 to 100 µg/l).
-- = not analyzed

TPHg = total petroleum hydrocarbons quantified as gasoline
TPHd = total petroleum hydrocarbons quantified as diesel
TPHmo = total petroleum hydrocarbons quantified as motor oil

Notes:

1. Sampling depth measured in feet below ground surface. Depth listed represents the bottom depth of the sample (i.e., 4 equals a six inch sample collected from 3.5 - 4.0 feet below ground surface).
2. "c" denotes composite sample.
3. -- = not analyzed.
4. Some result quantified as diesel, however chromatographic pattern not typical of fuel. (See Table 6 for details)
5. Additional analyses, total purgeable/total extractable petroleum hydrocarbons, performed for SRB56-1.0, SRB62-1.5, SRB62-6.0. Results were SRB62-1.0 = 330/8200; SRB62-1.5 = <1.1/25, and SRB62-6.0 = <1.2/97, respectively.
6. 10/6.8 = Result without silica gel cleanup/result with silica gel cleanup.

APPENDIX A

FIELD AND ANALYTICAL METHODS
JUNE THROUGH NOVEMBER 2002 INVESTIGATION

Santa Rosa Station Option Property
Santa Rosa, California

A.1 INTRODUCTION

The following sections summarize the field methods and analytical program utilized for pipeline removal and soil and groundwater investigation activities conducted at the Santa Rosa Station Option Property in June through November 2002.

A.2 FIELD METHODS

The field investigation was performed by Geomatrix between June 17, 2002 and November 14, 2002 in general accordance with the Work Plan for Removal of Subsurface Pipeline (Geomatrix, 2002a) and letters to the Regional Water Quality Control Board – North Coast Region (RWQCB) dated April 19, 2002[1], June 14, 2002[2], and November 4, 2002[3]. Field activities conducted in June through August 2002 consisted of removing approximately 300 feet of subsurface piping and collecting 12 samples for chemical analysis from the pipeline trench (PL-01 through PL-12); and advancing 41 soil borings (SRB-63 through SRB-103) for visual observation and collection of soil samples for chemical analysis from the fenced enclosure and the northwestern area of the site. The investigation also involved collection of soil samples from 12 locations within the pipeline excavation trench for chemical analysis and collection of grab groundwater samples from four locations for chemical analysis. Field activities conducted in November 2002 consisted of advancing six soil borings (SRB-53L, SRB-79L, SRB-88L, SRB-100L, PL-06L, and PL-12L) for collection of soil samples for chemical analysis.

A.2.1 PRE-FIELD ACTIVITIES

Prior to beginning the field program, Geomatrix prepared a site specific health and safety plan and contacted Underground Service Alert. Geomatrix subcontracted Subsurface Locating Service (Subsurface) of Petaluma, California to screen each boring location for the presence of

[1] *Work Plan for Exploratory Borings*, letter dated April 19, 2002.
[2] *Addendum to Work Plan for Exploratory Borings*, letter dated June 14, 2002.

subsurface utilities. Subsurface also marked out the location of the pipeline, in order to facilitate excavation activities.

Geomatrix obtained permits from the Sonoma County Department of Environmental Health Services for borings and a permit to excavate from the Santa Rosa Fire Department (SRFD). The current railroad operator, Railways, was notified prior to fieldwork, although the track that is located east of the site is currently inactive.

A.2.2 PIPELINE REMOVAL

On June 17 and 18, 2002, Clearwater Environmental Management, Inc. (Clearwater) of Fremont, California used a backhoe to pothole at nine locations along the suspected pipeline route. Pipes were exposed along the alignment shown on Figure 6 at an approximate depth of 1.5 feet to 2 feet below ground surface (bgs). Under the supervision of Geomatrix and SRFD personnel, Clearwater removed overburden soil from the pipeline route. The excavated soil was segregated in a stockpile adjacent to the excavation and covered with plastic sheeting. Following removal of overburden material, additional soil was removed above, below, and laterally adjacent to the pipes, exposing the entire length of the pipeline. The excavated soil was segregated from the overburden soil in a separate stockpile and covered with plastic sheeting.

Following excavation of the pipeline, Geomatrix identified couplings and joints along the pipes and performed a visual assessment of the structural integrity of individual segments, which appeared intact. Clearwater then used a vacuum truck to remove residual product in the pipes. Following removal of the product, Geomatrix proposed 12 soil sample locations in the pipeline trench (PL-01 through PL-12), which were subsequently approved by the RWQCB during an on-site meeting with Geomatrix personnel. Sample locations were spaced at intervals of approximately 20 feet, as called for in the work plan. The sample locations were selected to correspond to locations of pipeline joints or to locations of observed soil staining, as discussed with the SRFD. Samples of trench soil were collected at 12 locations along the trench in 6-inch-long by 2-inch-diameter brass sleeves that were sealed with Teflon® sheets, plastic end caps, and duct tape. Three five-gram samples also were collected at each sampling location using the EnCore® method in accordance with U.S. Environmental Protection Agency (EPA) Method 5035. The brass sleeves and Encore® samples were labeled, sealed in plastic bags,

[3] *Proposed Work Plan for Additional Evaluation of Petroleum in Soil,* letter dated November 4, 2002.

placed in an ice-cooled chest, and delivered under chain-of-custody procedures to STL San Francisco (STL) of Pleasanton, California, a California-certified analytical laboratory.

A.2.3 SOIL SAMPLING

Between June 17, 2002 and November 14, 2002, 47 soil borings were advanced with the fenced enclosure and the northwestern area of the site (not including the pipeline borings PL-01 through PL-12). Five soil borings were advanced within the fenced enclosure by a combination of potholing and hand augering. One soil boring was advanced using direct push technology within the fenced enclosure. Forty-one soil borings were advanced using direct push technology outside the fenced enclosure, in the northwestern area of the site near the Sixth Street Warehouse and the location of the former 3000-barrel aboveground storage tank (AST). Each of the above mentioned sampling methods are described in detail in the following sections.

A.2.3.1 Potholing/Hand Augering

Five soil borings (GMX-70, GMX-71, SRB-72, SRB-73, and SRB-96) were advanced within the fenced enclosure by a combination of potholing and hand augering. On June 20, 2002, Clearwater potholed the locations of SRB-72, SRB-73, and SRB-96 to a depth of about 5 feet bgs using a backhoe. Following potholing, Precision advanced the three borings to a total depth of 5 feet bgs by hand augering. On August 2, 2002, Geomatrix hand augered soil borings GMX-70 and GMX-71, located under a former storage trailer, from ground surface to a total depth of 5 feet bgs.

On November 14, 2002, Precision Sampling, Inc. (Precision), of Richmond, California, under the direction of Geomatrix field personnel, advanced two borings within the pipeline excavation trench to a total depth of 5 feet bgs by hand augering. The two borings were located directly adjacent to previous borings PL-06 and PL-12 and were named PL-06L and PL-12L, respectively. Soil samples were collected from the two boreholes at depths of approximately 1 and 5 feet bgs. Each sample was collected by filling a 6-inch-long by 2-inch-diameter brass sleeve at the desired sample interval. Each sleeve was then sealed with Teflon® sheets, plastic end caps, and duct tape. The brass sleeves were labeled, sealed in plastic bags, placed in an ice-cooled chest, and delivered under chain-of-custody procedures to Friedman and Bruya of Seattle, Washington, a California-certified analytical laboratory.

Soil samples were collected from the five boreholes at depths of approximately 1, 2, and 5 feet bgs. Each sample was collected by pushing a six-inch-long by two-inch-diameter brass sleeve

at the desired sample interval with a slide hammer. Each sleeve was then sealed with Teflon® sheets, plastic end caps, and duct tape. Three five-gram discrete-depth Encore® samples were also collected at each sampling depth in accordance with EPA Method 5035. The brass sleeves and Encore® samples were labeled, sealed in plastic bags, placed in an ice-cooled chest, and delivered under chain-of-custody procedures to STL.

A.2.3.2 Direct Push Technology

Thirty-five borings (SRB-63 through SRB-69, SRB-74 through SRB-95, and SRB-97 through SRB-103) were advanced between June 17, 2002 and July 10, 2002 and four borings (SRB-53L, SRB-79L, SRB-88L, and SRB-100L) were advanced on November 14, 2002. Borings SRB-53L, SRB-79L, SRB-88L, and SRB-100L were advanced in locations directly adjacent to previous borings SRB-53, SRB-79, SRB-88, and SRB-100, respectively. Continuous soil cores were collected by Precision by advancing a core barrel lined with stainless steel liners with a direct push drill rig at each boring. Recovered soil was described and logged by a Geomatrix geologist using the American Society Testing and Material (ASTM) Standard D2488-90 and Munsell color designations. A photoionization detector (PID) and visual observation were used to screen soil samples for visually impacted soil. Soil samples were collected from selected depths by sealing stainless steel liners with Teflon® sheets, plastic end caps, and duct tape. Selected sample depths were also sampled by collecting three five-gram discrete-depth Encore® samples in accordance with EPA Method 5035. Table A-1 provides a list of the depth intervals sampled at each boring location. Following collection, the stainless steel sleeves and Encore® samples were labeled, sealed in plastic bags, placed in an ice-cooled chest, and delivered under chain-of-custody procedures to either STL (June and July sampling events) or Freidman and Bruya (November sampling event).

Between each boring, all drilling equipment was steam-cleaned and all sampling equipment was decontaminated by scrubbing with distilled water and Alconox, followed by a distilled water rinse.

Upon completion of the borings, temporary casings were used as tremie pipes to backfill the borings from total depth to ground surface with Type I/II neat cement grout. Each boring location was later surveyed by a licensed surveyor.

A.2.4 GRAB GROUNDWATER SAMPLING

Prior to backfilling, grab groundwater samples were collected from four borings (SRB-74 through SRB-77) by advancing a drive casing with a disposable tip to total depth, placing a

temporary polyvinyl chloride (PVC) well screen within the drive casing, retracting the drive casing to expose the well screen to native sediments, and collecting groundwater samples through the well casing using a new, clean, disposable bailer. The temporary well screen was removed after sampling each location.

A.2.5 INVESTIGATION-DERIVED MATERIALS

All waste materials (e.g., soil cuttings and equipment wash water) generated during the sampling program were placed in appropriate containers, labeled, and temporarily stored within the fenced enclosure on site. Analytical results were used to characterize the waste for appropriate disposal by UPRR.

A.3 ANALYTICAL LABORATORY PROGRAM

The following sections summarize the analytical laboratory testing performed on soil and grab groundwater samples collected during the field program. Table A-1 summarizes the analytical testing performed for each sample collected. Appendix C contains the laboratory analytical results and chain-of-custody documentation.

A.3.1 SOIL

Soil samples were collected for chemical analysis from 37 borings at various sampling depths. Analyses performed on the soil samples included some or all of the following:

- benzene, toluene, ethylbenzene, and total xylenes (BTEX) and methyl tertiary butyl ether (MTBE) by U.S. Environmental Protection Agency (EPA) Method 8260B;
- total petroleum hydrocarbons characterized as diesel (TPHd) and motor oil (TPHmo) by EPA Method 8015M with silica gel cleanup by EPA Method 3630.
- total petroleum hydrocarbons characterized as gasoline (TPHg) by EPA Method 8015M;
- total petroleum hydrocarbons characterized as Bunker-C oil (Bunker-C) by EPA Method 8015M;
- polynuclear aromatic hydrocarbons (PAHs) by EPA Method 8270C SIM; and
- California waste extraction test (WET), modified using deionized water as the extract.

A.3.2 GROUNDWATER

Grab groundwater samples were collected from accumulated water within soil boring SRB-74 within the fenced enclosure and within soil borings SRB-75 through SRB-77 in the vicinity of the former 3000-barrel AST.

Each grab groundwater sample was analyzed for BTEX and MTBE by EPA Method 8260B and for TPHg, TPHd, and TPHmo by EPA Method 8015M. Samples analyzed for TPHd and TPHmo were prepared using a silica gel cleanup to remove polar biogenic material prior to analysis by EPA Method 3630. Where sufficient sample volume permitted (i.e., SRB-74, SRB-75, and SRB-77), a portion of the sample was filtered and analyzed for the same analytes listed above in order to compare the analytical results obtained for both filtered and unfiltered samples.

Geophysical Survey Report

NORCAL GEOPHYSICAL CONSULTANTS, INC.

October 19, 2001

Mr. Brenden Mulholland
Geomatrix Consultants, Inc.
2101 Webster Street, 12th Floor
Oakland, California 94612

Subject: Geophysical Investigation
Vacant Lot, 9 Fourth Street
Santa Rosa, California

Dear Mr. Mulholland:

This letter presents the findings of a geophysical investigation performed on a portion of a vacant lot at 9 Fourth Street in Santa Rosa, California. NORCAL Geophysicist David Bissiri conducted the field investigation on September 24, 2001.

SITE DESCRIPTION

The site is currently a vacant lot east of a brick warehouse and west of the district known as "Railroad Square", between Third and Fourth Streets. Past uses of the site reportedly include that of a produce canning facility and a railroad service yard. The investigation area, as established by NORCAL per your instructions, comprised an approximately 60- by 100-foot portion of the lot immediately east of the warehouse building (see Plate 1). Besides the warehouse, the notable cultural features of the site include a former loading dock with steel railing along the western boundary and a large soil mound in the northeast corner of the investigation area.

PURPOSE

The purpose of the investigation was to determine if steel underground storage tanks (UST's) reportedly associated with the railroad yard operations exist within the investigation area.

METHODOLOGY

The geophysical methods used for this investigation include vertical magnetic gradient (VMG), metal detection (MD), and ground penetrating radar (GPR) techniques. Detailed descriptions of the geophysical methods, instrumentation, and data interpretation are provided in Appendix "A"

DATA ACQUISITION

The first task undertaken at the site was establishing a survey grid to guide the VMG data acquisition. Following the grid set-up, we used a proton precession magnetometer to collect VMG data. Survey coverage consisted of north-south lines spaced five feet apart with measurement points along the lines at 5-foot intervals. The data were up-loaded to a field computer and

processed to produce a preliminary VMG contour map. This contour map was evaluated for localized magnetic variations that may be due to possible UST's or other suspicious buried ferrous objects.

Following the VMG investigation, the MD method was used in two ways: the first was that of site-specific investigations of suspect areas identified on the VMG contour map. This involved multi-directional traverses, approximately ten feet long spaced approximately 1-foot apart, centered on the suspect area; The second use of MD was to conduct a reconnaissance of the entire investigation area using north-south traverses spaced approximately three feet apart. Following this, the GPR was then used in two ways: First, it was used to investigate suspect VMG/MD anomalies in order to further characterize them. The second use of GPR was to investigate the two proposed well locations (SRMW- 9 and SRMW-10) for possible shallow sub-surface interferences to drilling. The last task undertaken in the field was to mark the findings on the ground and map their locations.

RESULTS

The VMG data is presented as the contour map on Plate1. Besides the VMG contour data, Plate 1 also depicts the locations of buried features detected with the metal detector; the locations of GPR traverses; the nearby building and loading dock; and the soil mound.

Based on our interpretations of the geophysical data and instrument responses, the results of our investigation can be summarized as follows:

- Several large VMG anomalies with magnitudes indicative of notable amounts of buried ferrous material are present in the eastern half of the investigation area

- Three shallowly buried, relatively small localized anomalies were detected with the metal detector. The locations of these metal-detector anomalies are depicted on Plate 1 as the shaded blue squares labeled "A", "B", and "C". Of the three anomalies, Anomaly A is particularly suspicious since it lies between two of the larger VMG anomalies (noted above) and is also at the apparent terminus of a suspected undifferentiated utility line (see below).

- One undifferentiated utility line extending southward from the vicinity of metal detector Anomaly "A" was detected. This line is depicted on Plate 1 as the dashed black line labeled "uu" along the eastern boundary of the investigation area.

- One minor disturbed area and a minor localized anomaly was detected with the GPR in the vicinity of proposed well SRMW-9, in the southeast corner of the investigation area. The disturbed area is depicted on Plate 1 as the black hachured area and the localized GPR anomaly is depicted as the short double-headed blue arrow. Neither of these features are suggestive of a UST.

More detailed discussions of the results are discussed below.

VMG

The VMG contour map displays the magnetic effects of numerous ferrous objects. These effects are seen as the tightly spaced, convoluted contour lines evident in several areas. Most notable of these are the "bull's eye" appearing anomalies in the eastern half of the investigation are, especially along the investigation area's eastern boundary. While these anomalies are of large enough magnitude and shape to suggest the existence of ferrous objects large enough to be UST's, the existence of other possible magnetic sources (such as the undifferentiated utility line and metal-detector anomalies) in the same vicinity do not allow definitive determination. In addition, given the former use of the site as a railroad yard, the existence of railroad related metallic debris is also a possibility. In contrast, all of the tightly spaced contours along the western boundary can be attributed to the magnetic effects of the steel rail along the former loading dock.

MD

The MD instrument response of Anomaly "A" was consistent with that typically produced by a shallowly buried, apparently flat metallic object. Based on the location of this anomaly with its possible association with nearby VMG anomalies and the suspected undifferentiated utility, this MD anomaly is somewhat suggestive of a manway. The instrument response of Anomalies "B" and "C" were consistent with those of shallowly buried metal debris. The object labeled "uu" (undifferentiated utility line) produced an instrument response suggestive of a section of pipe.

GPR

The GPR results for localized metal detector Anomalies "A", "B", and "C" were not conclusive other to than to confirm the presence of a shallowly buried metallic object at each location. The profiles of the two proposed well locations did not indicate the presence of any obstructions to drilling.

LIMITATIONS

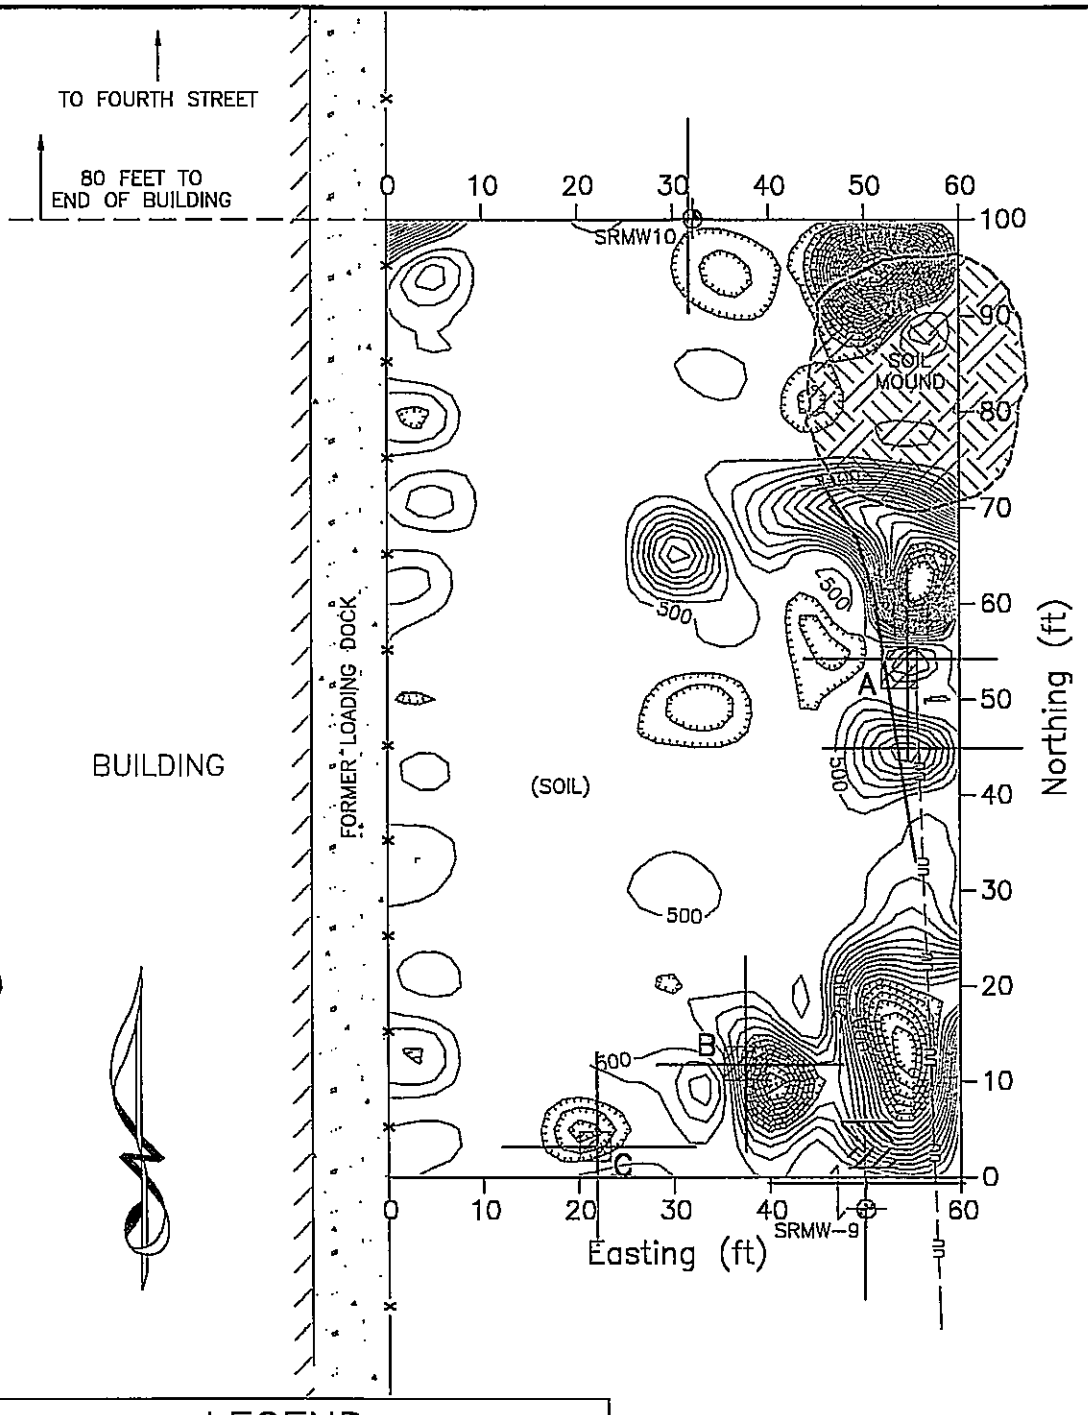
Not all buried objects or features can be detected or characterized by the remote sensing techniques that comprised this investigation. These often include: inactive electric, telephone, and CATV lines or those that are carrying little current where such current is required for them to be detected; non-metallic utility lines (e.g. plastic/terra-cotta sewer lines, fiber optic telephone lines, etc.); unreinforced concrete pads; concrete, fiberglass, or wooden underground storage tanks; or metal objects buried within the magnetic effect zone of other metal objects. To a large extent,

what ultimately determines the detectability of an object is the "signal-to-noise ratio" that can be obtained with each instrument. What determines the level of "noise" is different for each instrument. For magnetic instruments, noise can come from nearby metal objects or from electric lines. For GPR instruments it often is the soil conductivity and dielectric contrasts between the target and host material. The MD is affected by soil conductivity and nearby metal objects.

STANDARD CARE and WARRANTY

The scope of NORCAL's services for this project consisted of using geophysical methods to characterize the shallow subsurface. The accuracy of our findings is subject to specific site conditions and limitations inherent to the techniques used. The services were performed in a manner consistent with the level of skill ordinarily exercised by members of the profession currently employing similar methods. No warranty, with respect to the services or products delivered under this agreement, expressed or implied, is made by NORCAL. We appreciate having the opportunity to provide you with this information.

Respectfully,



NORCAL Geophysical Consultants, Inc.

David Bissiri
Geophysicist GP-1009

NORCAL

VERTICAL MAGNETIC GRADIENT CONTOUR MAP 9 FOURTH STREET

LOCATION: SANTA ROSA, CALIFORNIA

CLIENT: GEOMATRIX

JOB #: 01-325.08 | NORCAL GEOPHYSICAL CONSULTANTS INC.

DATE: SEP. 2001 | DRAWN BY: G.RANDALL | APPROVED BY: DJB

PLATE 1

Appendix A

GEOPHYSICAL METHODS, INSTRUMENTATION, DATA ANALYSIS, and LIMITATIONS

Appendix A

GEOPHYSICAL METHODS and INSTRUMENTATION

Vertical Magnetic Gradient (VMG)

A magnetic gradiometer measures the vertical gradient of the earth's magnetic field. NORCAL's gradiometer consists of two total field magnetic sensors separated vertically by one-half meter. The magnetic field strength is measured simultaneously at both of these sensors. The difference in magnetic intensity between these measurements is essentially the vertical gradient at that point of the earth's magnetic field. Because the vertical gradient is constant with respect to time, the diurnal corrections commonly needed for total field magnetics data processing is eliminated. In addition, since a gradiometer is affected less by cultural objects such as building walls, light poles than a total field magnetometer, VMG provides higher sensitivity and better resolution of near surface sources. Areas with significant amounts of buried metal typically produce anomalously steep magnetic gradients. However, because the gradiometer is sensitive to ferrous objects both above and below ground, site and vicinity surface conditions can affect survey results.

We used an SCINTREX ENVI-MAG magnetometer to obtain the vertical magnetic gradient data. The instrument features a built-in memory that stores the vertical magnetic gradient and survey grid information. The information can be up loaded to a computer for further processing.

Metal Detection (MD)

The method is used to detect buried near surface metal objects such as UST's, metal conduits, rebar in concrete, manhole covers, and various metallic debris. This is done by holding a radio transmitter-receiver unit above the ground and continuously scanning the surface. The unit utilizes two orthogonal coils that are mounted on a common staff. One of the coils transmits an electromagnetic signal (primary magnetic field) which in turn produces a secondary magnetic field about the subsurface metal object. Since the receiver coil is orthogonal to the transmitter coil (that is, in a "null" position), it is unaffected by the primary field. However, a buried metal object is not in a similar "null" position and therefore the secondary magnetic fields produced by the buried metal object will generate an audible response from the unit. The peak of this response usually occurs when the unit is directly over the metal object. Our MD instrument for this investigation was a Fisher TW-6 pipe and cable locator. The TW-6 does not provide a recordable data output that can be used for later computer processing. Results are generally limited to marking the interpreted outlines of detected objects in the field and mapping their locations.

Ground Penetrating Radar (GPR)

Ground penetrating radar is a method that provides a continuous, high resolution cross-section depicting variations in the electrical properties of the shallow subsurface. The method is particularly sensitive to variations in electrical conductivity and electrical permittivity (the ability of a material to hold a charge when an electrical field is applied).

The system operates by repeatedly radiating an electromagnetic pulse into the ground from a transducer (antenna) as it is moved along a traverse. Since most earthen and earthen-like

materials (such as concrete) are transparent to electromagnetic energy only a portion of the radar signal is reflected back to the surface from interfaces within such materials. When the signal encounters a metal object, however, much of the incident energy is reflected. The reflected signals are received by the transducer and processed by a control console. The data are then printed in cross-section form on a graphical recorder.

Buried tanks, drums, pipes, and rebar often appear on the records as multiple inverted "V" images imbedded within the more or less horizontal banding produced by the hosting media. The effective depth of penetration is ultimately a function of the signal-to-noise ratio of the reflected signal. The amplitude of the signal received by the transducer is dependant on several factors, among them geometrical spreading, scattering, and signal damping by the hosting material(s). Generally speaking, electrically conductive materials such as clay and saturated silt can limit radar performance by either damping and or scattering the radar signal, especially if pebbles and cobbles are present.

For this investigation, we used a Geophysical Survey Systems, Inc. SIR-2 Subsurface Interface Radar System equipped with a 500 megahertz (MHz) transducer. This system usually provides both the resolution and depth penetration for characterizing the shallow subsurface at a site such as this.

DATA ANALYSIS

Computer Processing

We up-loaded the VMG data to a portable computer and converted them into a format suitable for contouring. The contouring program then calculated an evenly spaced array of values (data grid) based on the observed field data. Finally, these gridded values were contoured to produce the VMG contour map.

Contour Map Interpretation

Generally speaking, in a region with uniform conditions VMG values will vary smoothly. In contrast, in areas where variations are strong the contours are closely spaced and often highly convoluted. Such closures may even form "bull's eye" appearing shapes. Such convoluted contours are typically considered anomalous when there are no obvious above ground sources causing the strong VMG variations. If the source of a particular anomaly is an isolated object or a group of closely spaced objects, the contours may form circular or elliptical closures. A large accumulation of buried objects may appear as a group of closely spaced, contorted anomalies or a single larger anomaly. Elongated objects such as buried rails and pipes often give rise to either elongated assemblages of contour lines parallel to the object or a string of circular/elliptical closures along the axis of the object.

Actual anomaly magnitude and shape are dependent on the relative position and size of the buried objects with respect to the location of the data points. In general, anomaly magnitude will decrease and anomaly width will increase as distance (depth) from the VMG sensors to the source increases. Anomalies may or may not have paired high and low values creating what are known as "dipoles". Isolated dipoles are often, but not always, attributed to a single magnetic object such as a UST, vault, etc. Isolated high or low values are known as "monopoles". Monopoles that are

centered on a single data point and limited in extent to roughly the data point spacing of the sampling grid are often caused by small, near surface objects. Such objects are typically well caps, pull boxes, balls of wire, etc. Larger monopoles that extend across an area equal to several data point station spacings are typically associated with larger objects such as steel cased wells, ends of long pipes, etc.

LIMITATIONS

VMG Techniques

Below ground metal ferrous objects produce localized variations in the earth's magnetic field. The magnetic intensity associated with buried metal depends on the mass of the metal and the distance the metal object is from the magnetometer sensor. As the distance between the object and the magnetometer sensor increases, the intensity of the associated field decreases, thereby making detection more difficult.

In addition, the ability to detect a buried metal object is based on the difference in intensity of these variations and the intensity of background variations. The intensity of background variations is based on the amount of above and below ground metal there is within a given survey area. Cultural features such as chain link fences, buildings, debris, railroad spurs, utilities, above ground electric lines, etc. typically produce numerous magnetic variations with high intensities. These variations may mask effects from buried metal objects, or make it very difficult to determine whether the magnetic variations are associated with below ground metal or above/below ground cultural features.

MD Techniques

In general, the response of the electromagnetic metal detection instrument is proportional to the horizontal surface area of shallowly buried subsurface objects (typically in the upper three or four feet). This relationship can be used to advantage in locating buried metal debris, buried reinforced concrete pads, and utilities. However, in the presence of above ground metallic objects such as fences, walls, parked cars, and metal debris this is no longer valid. In some instances, the presence of such objects can make it very difficult to determine whether the instrument responses are associated with below ground targets or above ground cultural features. As with terrain conductivity techniques, when multiple sources are present it may not be possible to identify individual targets.

GPR Techniques

The ability to detect subsurface targets is dependent on site specific conditions. These conditions include depth of burial, the size or diameter of the target, the condition of the specific target in question, the type of backfill material associated with the target, and the surface conditions over the target. Typically, the GPR depth of detection will be reduced as the clay content in the subsurface increases. Therefore, it is possible that targets (UST's and utilities), buried greater than 2 to about 4 feet, may not be detectable by the GPR technique.

Legend and Notes

Analysis Flag

rl

Reporting limits raised due to reduced sample size.

Result Flag

ndp

Hydrocarbon reported does not match the pattern of our Diesel standard

rpd

Analyte RPD was out of QC limits due to sample heterogeneity.

sh

Surrogate recovery was higher than QC limit due to matrix interference.

Sample Receipt Checklist

Submission #: 2002- 07 - 0202

Checklist completed by: (initials) DSH Date: 07 / 11 /02

Courier name: ☐ STL San Francisco ☒ Client _____

Custody seals intact on shipping container/samples	Yes ✓	No ___	Not Present ___
Chain of custody present?	Yes ✓	No ___	
Chain of custody signed when relinquished and received?	Yes ✓	No ___	
Chain of custody agrees with sample labels?	Yes ✓	No ___	
Samples in proper container/bottle?	Yes ✓	No ___	
Sample containers intact?	Yes ✓	No ___	
Sufficient sample volume for indicated test?	Yes ✓	No ___	
All samples received within holding time?	Yes ✓	No ___	
Container/Temp Blank temperature in compliance (4^0 C ± 2)?	Temp: 7.7 °C	Yes ___	No ✓ (1)
Water - VOA vials have zero headspace?	No VOA vials submitted ✓	Yes ___	No ___

(if bubble is present, refer to approximate bubble size and itemize in comments as S (small ~O), M (medium ~ O) or L (large ~ O)

Water - **pH acceptable upon receipt?** ☐ Yes ☐ No

☐ **pH adjusted**– Preservative used: ☐ HNO_3 ☐ HCl ☐ H_2SO_4 ☐ NaOH ☐ ZnOAc

For any item check-listed "No", provided detail of discrepancy in comment section below:

Comments: (1) plenty of ice

Legend and Notes

Result Flag

msl

Analyte MS/MSD recoveries were out of QC limits due to Parent sample target analyte concentration exceeding the spiked amount by greater than 4X.

ndp

Hydrocarbon reported does not match the pattern of our Diesel standard

sd

Surrogate recovery not reportable due to required dilution.

Case Narrative

General and Sample Comments

We (STL San Francisco) received 26 Soil samples , on Thursday, June 20, 2002 5:25 PM.

Analysis Coments and Flags by QC Batch

TEPH w/ Silica Gel Clean-up	Soil	QC Batch#: 2002/06/21-04.10

SRB-95-0.5 >> MSD 2002/06/21-04.10-005
Compound Flag(s)
mso MS/MSD spike recoveries were out of QC limits due to matrix interference. Precision and Accuracy were verified by LCS/LCSD.

SRB-95-0.5 >> MSD 2002/06/21-04.10-005
Compound Flag(s)
rpd Analyte RPD was out of QC limits due to sample heterogeneity.

SRB-95-0.5 2002-06-0377-018
Compound Flag(s)
ndp Hydrocarbon reported does not match the pattern of our Diesel standard

SRB-95-0.5 2002-06-0377-018
Compound Flag(s)
sd Surrogate recovery not reportable due to required dilution.

SRB-95-3.0 2002-06-0377-019
Compound Flag(s)
sd Surrogate recovery not reportable due to required dilution.

SRB-95-3.0 2002-06-0377-019
Compound Flag(s)
ndp Hydrocarbon reported does not match the pattern of our Diesel standard

SRB-95-5.0 2002-06-0377-020
Compound Flag(s)
ndp Hydrocarbon reported does not match the pattern of our Diesel standard

SRB-96-0.5 2002-06-0377-021
Compound Flag(s)
sd Surrogate recovery not reportable due to required dilution.

SRB-96-0.5 2002-06-0377-021
Compound Flag(s)
ndp Hydrocarbon reported does not match the pattern of our Diesel standard

SRB-72-0.5 2002-06-0377-024
Compound Flag(s)
ndp Hydrocarbon reported does not match the pattern of our Diesel standard

SRB-72-3.0 2002-06-0377-025
Compound Flag(s)
sd Surrogate recovery not reportable due to required dilution.

Legend and Notes

Result Flag

mso

MS/MSD spike recoveries were out of QC limits due to matrix interference. Precision and Acc verified by LCS/LCSD.

ndp

Hydrocarbon reported does not match the pattern of our Diesel standard

rpd

Analyte RPD was out of QC limits due to sample heterogeneity.

sd

Surrogate recovery not reportable due to required dilution.

Sample Receipt Checklist

Submission #: 2002- 06 - 0377

Checklist completed by: (initials) CR Date: 06/21/02

Courier name: ☐ STL San Francisco ☐ Client World

Custody seals intact on shipping container/samples (no seals)	Yes____ No____	Not Present ✓
Chain of custody present?	Yes ✓ No____	
Chain of custody signed when relinquished and received?	Yes ✓ No____	
Chain of custody agrees with sample labels?	Yes ✓ No____	
Samples in proper container/bottle?	Yes ✓ No____	
Sample containers intact?	Yes ✓ No____	
Sufficient sample volume for indicated test?	Yes ✓ No____	
All samples received within holding time?	Yes ✓ No____	
Container/Temp Blank temperature in compliance (4^{o} C ± 2)?	Temp: 4.0 °C	Yes ✓ No____
Water - VOA vials have zero headspace?	No VOA vials submitted ✓	Yes____ No____

(if bubble is present, refer to approximate bubble size and itemize in comments as S (small ~O), M (medium ~ O) or L (large ~ O)

Water - pH acceptable upon receipt? ☐ Yes ☐ No

☐ pH adjusted– Preservative used: ☐ HNO_3 ☐ HCl ☐ H_2SO_4 ☐ NaOH ☐ ZnOAc

For any item check-listed "No", provided detail of discrepancy in comment section below:

Comments:

Project Management [Routing for instruction of indicated discrepancy(ies)]

Project Manager: (initials) _____ Date: ____/____/02

Client contacted: ☐ Yes ☐ No

Summary of discussion:

Corrective Action (per PM/Client):

Sample Receipt Checklist

Submission #: 2002- 06 - 0351

Checklist completed by: (initials) NH Date: 06/20/02

Courier name: ☐ STL San Francisco ☐ Client World

Custody seals intact on shipping container/samples	Yes____ No____	Not Present ✓
Chain of custody present?	Yes ✓ No____	
Chain of custody signed when relinquished and received?	Yes ✓ No____	
Chain of custody agrees with sample labels?	Yes____ No ✓	
Samples in proper container/bottle?	Yes ✓ No____	
Sample containers intact?	Yes ✓ No____	
Sufficient sample volume for indicated test?	Yes ✓ No____	
All samples received within holding time?	Yes ✓ No____	
Container/Temp Blank temperature in compliance (4^{o} C ± 2)?	Temp: 5.0 °C Yes ✓ No____	
Water - VOA vials have zero headspace?	No VOA vials submitted ✓ Yes____ No____	

(if bubble is present, refer to approximate bubble size and itemize in comments as S (small ~O), M (medium ~ O) or L (large ~ O)

Water - pH acceptable upon receipt? ☐ Yes ☐ No

☐ pH adjusted– Preservative used: ☐ HNO_3 ☐ HCl ☐ H_2SO_4 ☐ NaOH ☐ ZnOAc

For any item check-listed "No", provided detail of discrepancy in comment section below:

Comments: ID: SRB-90-2.0, SRB-90-7, SRB-90-5.0, SRB-90-8.0, and SRB-90-11.0 are listed twice on COC. Received no sample for ID; SRB-84-15, SRB-84-8.0, SRB-84-11, SRB-84-14 and SRB-84-17

Project Management [Routing for instruction of indicated discrepancy(ies)]

Legend and Notes

Result Flag

mso

MS/MSD spike recoveries were out of QC limits due to matrix interference. Precision and Accuracy were verified by LCS/LCSD.

ndp

Hydrocarbon reported does not match the pattern of our Diesel standard

rpd

Analyte RPD was out of QC limits due to sample heterogeneity.

sd

Surrogate recovery not reportable due to required dilution.

Afsaneh:

Please analyze the following samples that were submitted to the laboratory for Geomatrix project 2770.005. Please note that the holding time for samples SRB-80 and 83 expire today:

SRB-75-17, SRB-75-20;
SRB-80-16.0, SRB-80-21.5;
SRB-83-9, SRB-83-14, SRB-83-21;
SRB-90-14, SRB-90-17;
SRB-93-14, SRB-93-18;
SRB-99-14, SRB-99-17, SRB-99-23; and,
SRB-100-7.5, SRB-100-14, SRB-100-20.

Please analyze each sample for:

- TPH as Diesel and TPH as Motor Oil by EPA method 8015M
- Polynuclear aromatic hydrocarbons using EPA Method 8270 SIM.

Thank you,

Legend and Notes

Result Flag

mso

MS/MSD spike recoveries were out of QC limits due to matrix interference. Precision and Accuracy were verified by LCS/LCSD.

ndp

Hydrocarbon reported does not match the pattern of our Diesel standard

sd

Surrogate recovery not reportable due to required dilution.

Geomatrix Consultants, Inc.
2101 Webster Street, 12th Floor
Oakland, CA 94612

Dear Mr. Rome:

Included are the results from the testing of material submitted on November 15, 2002 from your 2770.005 project. Any samples that may remain are currently scheduled for disposal in 30 days. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Charlene Morrow

CASE NARRATIVE

This case narrative encompasses samples received on November 15, 2002 by Friedman & Bruya, Inc. from the Geomatrix Consultants, Inc. 2770.005 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Geomatrix Consultants, Inc.
211125-01	SRB-100L-4.75
211125-02	SRB-100L-8.0
211125-03	SRB-79L-5.0
211125-04	SRB-79L-11.0
211125-05	SRB-53L-5.0
211125-06	SRB-53L-11.0
211125-07	SRB-88L-8.0
211125-08	SRB-88L-11.0
211125-09	PL-06L-1.0
211125-10	PL-06L-5.0
211125-11	PL-12L-1.0
211125-12	PL-12L-5.0

All quality control requirements were acceptable except for the following.

For analysis of diesel range material following extraction by the modified CA WET method, laboratory contamination was found in the method blanks and samples. This was due to the procedure which was necessary to remove fine suspended particulates. The contamination was removed with silica gel cleanup.

For analysis of diesel range material following silica gel cleanup, surrogate recoveries for several samples were outside of normal acceptance criteria. In addition, the RPD for LCS/LCSD results was outside of normal acceptance criteria.

For analysis of diesel and motor oil range material following extraction by the modified CA WET method, the RPD for duplicate sample results was outside of normal acceptance criteria, possibly due to sample inhomogeneity.

Benzo(k)fluoranthene	<500
Benzo(a)pyrene	<500
Indeno(1,2,3-cd)pyrene	<500
Dibenzo(a,h)anthracene	<500
Benzo(g,h,i)perylene	<500

Note: The sample was diluted due to high levels of interfering compounds. Detection limits are raised due to dilution and surrogate recoveries may not be meaningful.

Analysis For PNA Compounds By EPA Method 8270C SIM

Client Sample ID:	Method Blank	Client:	Geomatrix Consultants, Inc.
Date Received:	Not Applicable	Project:	2770.005
Date Extracted:	11/20/02	Lab ID:	02-866 mb8
Date Analyzed:	11/23/02	Data File:	112219.D
Matrix:	Soil	Instrument:	GCMS3
Units:	ug/kg (ppb)	Operator:	YA

Surrogates:	% Recovery	Lower Limit	Upper Limit
Anthracene-d10	78	43	109
Benzo(a)anthracene-d12	83	65	134

Compounds:	Concentration: ug/kg (ppb)
Naphthalene	<5
Acenaphthylene	<5
Acenaphthene	<5
Fluorene	<5
Phenanthrene	<5
Anthracene	<5
Fluoranthene	<5
Pyrene	<5
Benz(a)anthracene	<5
Chrysene	<5
Benzo(b)fluoranthene	<5
Benzo(k)fluoranthene	<5
Benzo(a)pyrene	<5
Indeno(1,2,3-cd)pyrene	<5
Dibenzo(a,h)anthracene	<5
Benzo(g,h,i)perylene	<5

FRIEDMAN & BRUYA, INC.

ENVIRONMENTAL CHEMISTS

Date of Report: 12/13/02
Date Received: 11/15/02
Project: 2770.005

QUALITY ASSURANCE RESULTS FROM THE ANALYSIS OF SOIL SAMPLES FOR TOTAL PETROLEUM HYDROCARBONS AS DIESEL USING EPA METHOD 8015M

Laboratory Code: 211135-05 (Duplicate)

Analyte	Reporting Units	Sample Result	Duplicate Result	Relative Percent Difference (Limit 20)
Diesel	µg/g (ppm)	<10	<10	nm

Laboratory Code: 211135-05 (Matrix Spike)

Analyte	Reporting Units	Spike Level	Sample Result	Percent Recovery MS	Acceptance Criteria
Diesel	µg/g (ppm)	500	<10	100	62-142

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Diesel	µg/g (ppm)	500	108	108	66-132	0

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

Date of Report: 12/13/02
Date Received: 11/15/02
Project: 2770.005

QUALITY ASSURANCE RESULTS FROM THE ANALYSIS OF SOIL SAMPLES FOR TOTAL PETROLEUM HYDROCARBONS AS MOTOR OIL USING EPA METHOD 8015M

Laboratory Code: 211135-05 (Duplicate)

Analyte	Reporting Units	Sample Result	Duplicate Result	Relative Percent Difference (Limit 20)
Motor Oil	µg/g (ppm)	<50	<50	nm

Laboratory Code: 211135-05 (Matrix Spike)

Analyte	Reporting Units	Spike Level	Sample Result	Percent Recovery MS	Acceptance Criteria
Motor Oil	µg/g (ppm)	250	<50	94	65-135

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Motor Oil	µg/g (ppm)	250	96	101	65-135	6

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

Date of Report: 12/13/02
Date Received: 11/15/02
Project: 2770.005

QUALITY ASSURANCE RESULTS FROM THE ANALYSIS OF CA WET-M EXTRACT SAMPLES FOR TOTAL PETROLEUM HYDROCARBONS AS DIESEL USING EPA METHOD 8015M

Laboratory Code: 211125-01 (Duplicate)

Analyte	Reporting Units	Sample Result	Duplicate Result	Relative Percent Difference (Limit 20)
Diesel	µg/L (ppb)	350	860	84 vo

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Diesel	µg/L (ppb)	667	112	128	71-128	14

vo - The value reported fell outside the control limits established for this analyte.

Date of Report: 12/13/02
Date Received: 11/15/02
Project: 2770.005

QUALITY ASSURANCE RESULTS FROM THE ANALYSIS OF CA WET-M EXTRACT SAMPLES FOR TOTAL PETROLEUM HYDROCARBONS AS DIESEL USING EPA METHOD 8015M

Laboratory Code: 211125-01 (Duplicate) Silica Gel

Analyte	Reporting Units	Sample Result	Duplicate Result	Relative Percent Difference (Limit 20)
Diesel	µg/L (ppb)	<50	<50	nm

Laboratory Code: Laboratory Control Sample Silica Gel

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Diesel	µg/L (ppb)	667	83	110	71-128	28 vo

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

vo - The value reported fell outside the control limits established for this analyte.

August 31, 2007

Mr. Mike Grant
Union Pacific Railroad
Manager Environmental Site Remediation
1408 Middle Harbor Road
Oakland, CA 94607

Dear Mr. Grant:

Subject: No Further Action

File: Southern Pacific Transportation Company, 3rd Street Property
Santa Rosa, Case No. 1TSR196

On February 23, 2007, Regional Water Board staff identified items remaining to be completed prior to the issuance of a no further action letter. They included:

- Submittal of documentation showing proper groundwater monitoring well abandonment;
- Submittal of documentation showing completion of waste disposal activities;
- Compliance with the State Water Resources Control Board, Geotracker data base electronic submittal requirements; and
- A written commitment from the person, or persons who will be taking responsibility for the preparation and implementation of a Soil and Groundwater Management Plan.

The first three bulleted items were completed by Union Pacific Railroad. Based on the April 16, 2007 correspondence from Sonoma-Marin Area Rail Transit (SMART), the soil and groundwater management plan will be prepared and implemented by SMART.

Accordingly, no further action is required regarding corrective actions completed for known discharges to soil and groundwater on properties identified as APN 010-166-003 and 010-171-004.

The areas where soil removal previously occurred or where off site migration has occurred may be subject to further regulation, if disturbed during land use changes

and/or property development. Remaining shallow soil impacts, and potential encounters with currently unknown areas of impact must be addressed during the property development process, according to an approved soil and groundwater management plan.

Acceptable components of the soil and groundwater management plan were identified in our February 23, 2007 correspondence. We look forward to receipt and review of that plan in the near future.

This letter does not relate to rail road right of way land south of Third Street where unresolved soil and groundwater issues remain.

If you have any questions, you may call Joan Fleck of my staff at (707) 576-2675.

Sincerely,

Original Signed By:

Oakland, CA 94607

Dear Mr. Grant:

Subject: ANNUAL ESTIMATION LETTER
File: Southern Pacific Transportation Company
Third Street
Case No. 1TSR196; (201-6200)

The California Water Code (Porter-Cologne), Section 13304, allows the Regional Water Board to recover reasonable expenses from a responsible party for overseeing site investigation and cleanup of unregulated discharges adversely affecting or threatening to affect State's waters. The Regional Water Board intends to continue to recover costs for regulatory oversight work conducted at this site in accordance with our prior correspondence on this matter. In compliance with AB2057, our agency is obligated to inform you every year of the following information regarding our recovery of oversight costs:

1. A detailed estimate of the work to be performed or services to be provided;
2. A statement of the expected outcome of that work;
3. The billing rates of all individuals and classes or employees expected to engage in the work; and
4. An estimate of all expected charges to be billed to you by this agency.

ESTIMATE OF WORK TO BE PERFORMED:

Regional Water Board staff estimate that the following work will be performed during fiscal year 2007/2008 on the Southern Pacific Transportation Company site:

- Evaluate the site status to assess compliance with Regional Water Board requirements and California Water Code;
- Meet with and provide written correspondence and telephone communication with representatives of Union Pacific and other responsible third parties and interested parties;
- Conduct internal communications (i.e., meetings, memos, etc.) regarding the project; and
- Provide regulatory oversight through the completion of the project.

STATEMENT OF EXPECTED OUTCOME

- Verify adequacy of final reports;
- Prepare meeting summaries, telephone conversation summaries, etc. to document the file record and site progress; and
- Complete no further action process.

BILLING RATES

Enclosure 1 is a summary of the billing rates for employees expected to perform the work. The names and classifications of employees that charge time to this site will be listed on the invoices. The average billing rate is about $125.00 per hour.

ESTIMATION OF EXPECTED CHARGES

Regional Water Board staff expects to charge about 8 hours of work related to this site during fiscal year 2007/2008 (July 1, 2007 through June 30, 2008). Based on the average billing rate of $125.00 per hour, the estimated billing charge for this site during fiscal year 2007/2008 is about $1,000.00.

If you have any questions, please call me at (707) 576-2675.

Sincerely,

Original Signed By:

Gentlemen:

Subject: Case Status
File: Southern Pacific Transportation Company, 3rd Street Property, Santa Rosa, Case No. 1TSR196

Regional Water Board staff have reviewed the November 2008 *Report of Findings Sonoma-Marin Area Rail Transit Property* report and the January 7, 2009 *Additional Information* prepared by EBA Engineering on behalf of New Railroad Square LLC. The work was conducted on properties identified as Assessor's Parcel Numbers 010-171-004 and 010-166-003 in Santa Rosa. The Phase II work was completed in relation to a proposed development project.

The results of the Phase II work included the discovery of an underground oil storage tank, shallow soil impacts, and groundwater impacts from petroleum and chlorinated hydrocarbons. The soil and groundwater impacts discovered in the vicinity of SB-1A represent new information regarding an onsite discharge; therefore, the case file has been re-opened.

We concur with the EBA Engineering recommendations to remove the underground oil storage tank under permit from the Santa Rosa Fire Department, prepare a work plan to address the soil and groundwater impacts in the vicinity of SB-1A, and prepare a soil and groundwater management plan to address the shallow soil impacts prior to and during property development. The underground storage tank must be removed as soon as possible. The work plan to address the soil and groundwater impacts in the vicinity of SB-1 is due within 60 days of issuance of this letter. The soil and groundwater

management plan must be submitted prior to property development. We also concur with the proposal to install groundwater monitoring wells after corrective actions have been conducted in the area of SB-1A. Based on the available information, it appears that off site migration has occurred to the west. The work plan must acknowledge and address this matter.

With regards to the widespread volatile organic compound (VOC) impacts, a potential MTBE source is 210 Fifth Street. I am currently researching historical land uses in the area east of the site for potential up gradient tetrachloroethene (PCE) discharge locations. With regards to groundwater impacts from petroleum, that appear to be the result of on site migration, I have forwarded copies of pertinent information for the SB-55-W area to ChevronTexaco, who is currently investigating a petroleum release at 101 Fifth Street. I am also exploring land use history for properties east of the SB-13-W sample location.

I look forward to removal of the underground storage tank and receipt of the work plan. If you have any questions I can be reached at (707) 576-2675.

Sincerely,

Joan Fleck
Engineering Geologist

Recommendation for Site Closure
Santa Rosa Station/Third Street Property
Option Property
Santa Rosa, California

Dear Ms. Fleck:

On behalf of Union Pacific Railroad Company (UPRR) and the Northwestern Pacific Railroad Authority (NWPRA), Geomatrix Consultants, Inc. (Geomatrix) is submitting this report that documents results of soil and grab groundwater sampling recently performed at the subject site. The work was performed in accordance with our November 19, 1999 work plan and February 7, 2000 addendum to the work plan. The work plan and addendum were approved by the California Regional Water Control Board, North Coast Region (RWQCB). Additionally, this report summarizes the results of previous investigative work performed at the site, and presents our rationale for our recommendation that regulatory closure be authorized for the site at this time.

Please call John Moe of UPRR at (415) 541-7020, David Solomon of the NWPRA at (415) 257-4564, or the undersigned if you have any questions.

Sincerely yours,
GEOMATRIX CONSULTANTS, INC.

1.0 INTRODUCTION

Geomatrix Consultants, Inc. (Geomatrix), has prepared this report to document the results of the soil and grab groundwater sampling event and chemical analysis program conducted at the former Santa Rosa Station, which is located along the Healdsburg segment of the Northwestern Pacific Railroad (NWPRR) corridor in Santa Rosa, California (Figure 1). This property, shown on Figure 2, is designated as an option sale property for the transaction between the Southern Pacific Transportation Company [SPTCo; currently Union Pacific Railroad (UPRR)] and the Northwestern Pacific Railroad Authority (NWPRA, a public joint powers authority composed of Golden Gate Bridge, Highway and Transportation District, County of Marin, and North Coast Railroad Authority). The objective of the soil and groundwater-sampling program was to provide additional characterization of potential environmental issues at the subject site and collect data necessary to move the site toward regulatory case closure. Geomatrix performed this work on behalf of UPRR and NWPRA in accordance with our November 18, 1999 work plan and February 7, 2000 addendum work plan. Both work plans were approved orally by the California Regional Water Quality Control Board, North Coast Region (RWQCB) staff (personal communication, Ms. Joan Fleck, March 3, 1999).

Site background, a description of the sampling program, a discussion of the findings, and recommendations are presented in the following sections.

2.0 SITE SETTING

The property is located in a primarily commercial area of Santa Rosa. The property is bordered by the NWPRR property to the south and east, warehouse facilities to the west, and residential and commercial areas to the north. The property is currently vacant with the exception of 1) a small railroad maintenance yard in the center of the site, which is used by Northwestern Pacific Railway Company, LLC, the current operator of freight services on the right-of-way; and 2) an enclosure in the northern part of the site where some privately-owned rail cars are stored. Active railroad tracks run along the eastern side of the site.

Based on past work performed by Geomatrix at the subject site and along the NWPRR immediately east of the property, the stratigraphy generally consists of fine-grained sediment (clay, sandy clay, and clay with sand) to a depth of 16 to 21 feet bgs. A clayey sand unit that ranged in thickness from 3 to 7 feet was encountered in borings located in the southeastern portion of the site at depths of 7 to 10 feet bgs; this clayey sand was also encountered in the western portion of the site at a depth of about 12 feet bgs, and was about 1.5 feet thick. A 4- to 6-foot thick poorly graded sand with gravel to clayey sand was encountered between 16.5 to 21 feet bgs.

Depth to groundwater was measured by Geomatrix on March 16, 1995 in one well located on the NWPRR south of the property and was approximately 11.5 feet below ground surface (bgs). Groundwater was encountered by Geomatrix during previous grab groundwater sampling activities at depths of approximately 10 to 12 feet bgs. Groundwater gradients are assumed to be west-southwest toward Santa Rosa Creek.

3.0 BACKGROUND

The Santa Rosa station formerly was used as a water and fuel station for the railroad. Within the southeastern portion of the option property was a turntable that was dismantled in 1925. A 3000-barrel[1] (126,000 gallons) above ground oil storage tank, two oil traps, and an oil column also were located along the western boundary of the option property (Figure 2). According to SPTCo records, these facilities were constructed between 1939 and 1945, and were removed in 1960. An office and fuel storage house is currently in the north-central portion of the option property; this structure is located within a fenced enclosure where various maintenance materials are stored.

Three USTs that were located immediately north-northwest of the fenced enclosure (10,000-gallon diesel UST, 10,000-gallon gasoline UST, and 230-gallon fuel oil UST) were removed in 1987. Canonie Environmental documented no apparent leakage from the USTs at the time of their removal.

In April 1990, the NCRWQCB drilled four borings in the western portion of the property and installed monitoring wells in two of the borings (designated MW-2 and MW-3, as shown on Figure 2; the borings were designated as B-1 and B-2). Monitoring well MW-3 was located approximately 100 feet downgradient (to the southwest) of the former fuel oil UST. Based on

[1] One barrel = 42 gallons

information presented in a July 1992 report by Industrial Compliance (IC), analytical results for samples collected from the RWQCB borings showed that no petroleum hydrocarbons were present in soil samples collected from soil boring B-1; however, oil and grease was present in the soil sample collected from boring B-1 at 12 feet bgs at a concentration of 200 milligrams per kilogram (mg/kg). Additionally, this sample contained low concentrations of polynuclear aromatic hydrocarbons (PNAs).[2] Soil samples collected at depths of 6 and 16 feet bgs from soil boring MW-3 contained petroleum hydrocarbons quantified as diesel (TPHd) at concentrations of 11 and 30 mg/kg, respectively.

No petroleum hydrocarbons were detected in the groundwater sample collected by the RWQCB from monitoring well MW-2; TPHd was detected at a concentration of 0.4 milligrams per liter (mg/l) in the groundwater sample collected at monitoring well MW-3.

Soil and grab groundwater samples were collected from five borings located near the former UST area by IC in 1992. The approximate sampling locations are shown on Figure 2. No detectable concentrations of petroleum hydrocarbons, benzene, toluene, ethylbenzene, or xylenes (BTEX), or PNAs were reported in any of the soil samples collected. Grab groundwater samples collected from the location of the former diesel and gasoline USTs did not contain petroleum hydrocarbons or BTEX above laboratory reporting limits. The grab groundwater sample collected from the former fuel oil tank location, designated as IC-B6 on Figure 2, reportedly contained TPHd at concentrations of 31 mg/l; no gasoline or BTEX were detected in the grab groundwater sample collected from IC-B6.

The RWQCB destroyed monitoring wells MW-2 and MW-3 in June 1995 (October 30, 1996, personal communication, Joan Fleck of the RQWCB).

In November 1996, Geomatrix performed an investigation of soil and groundwater at the site to evaluate potential significant environmental impacts resulting from historical features or features identified during previous investigations and to respond to a request by the RWQCB to perform additional characterization in the vicinity of the former underground fuel oil tank. Twelve borings (SRB20 through SRB31) were drilled and samples were analyzed for TPHd, total petroleum hydrocarbons quantified as motor oil (TPHm), PNAs, metals, and volatile

[2] The following PNAs were detected in the soil sample collected from RWQCB boring B-1 at 12 feet: naphthalene (2.08 mg/kg), 2-methylnaphthalene (1.15 mg/kg), acenaphthene (1.45 mg/kg), dibenzofuran (1.13 mg/kg), fluorene (1.38 mg/kg), phenanthrene (3.86 mg/kg), anthracene (0.577 mg/kg), fluoranthene (1.13 mg/kg), pyrene (1.13 mg/kg), benzo(a)anthracene (0.324 mg/kg), and bis(2-ethylhexyl)phthalate (0.327 mg/kg).

organic compounds (VOCs). Soil samples collected for analyses of TPHd, PNAs, and metals were composited vertically from each boring; discrete samples subsequently were analyzed if elevated concentrations of constituents were detected. Only discrete samples were analyzed for VOCs. The results of the previous samples are incorporated with results from the recent sampling program in Tables 1 through 4.

Petroleum hydrocarbons were detected in soil at elevated concentrations in boring SRB20 and SRB21, however the presence of petroleum hydrocarbons at these locations decreased with depth. Specifically, the shallower composite sample from SRB20 contained TPHm at a concentration of 900 mg/kg. Discrete samples from depths of 4.0 and 6.5 feet contained TPHm at concentrations of 69 mg/kg and less than 5 mg/kg, respectively. No TPHd was detected in soil samples from boring SRB20. In SRB21, TPHm was present at a concentration of 510 mg/kg in the shallow composite sample; no TPHm was detected in deeper, discrete samples from this boring. Shallow composite and deeper discrete soil samples from boring SRB21 contained TPHd, at a maximum concentration of 1,600 mg/kg. The concentration of TPHd in this boring decreased with depth and was not detected in the sample collected from 13.5 feet bgs. PNAs were detected in soil at concentrations below 1996 EPA screening criteria for industrial exposure.[3] Concentrations of PNAs detected at this time, as shown on Table 2, are also below current PRGs (USEPA, 1999). For example, the maximum detected concentration of benzo(a)pyrene was 0.026 mg/kg in the discrete sample collected from a depth of 12.5 feet bgs in boring SRB22; the current PRG for benzo(a)pyrene is 0.29 mg/kg. The highest PNA concentration detected was in the discrete soil sample collected from a depth of 7 feet bgs in boring SRB22. In this sample, flourene was detected at a concentration of 0.87 mg/kg; the PRG for flourene is 33,000 mg/kg. Metals concentrations in soil were within expected background concentrations and less than 10 times the soluble threshold limit concentration (STLC)[4] in all of the soil samples (discrete and composite). Concentrations of metals in soil samples also were below industrial PRGs.

No TPHd, TPHm, or VOCs were detected in groundwater above laboratory reporting limits.

The results of the 1996 sampling program indicated no significant environmental issues at the site. However, based on its review of the results of the November 1996 work, the RWQCB requested that additional issues be addressed before case closure would be considered. These

[3] United States Environmental Protection Agency (EPA), 1996, Region 9 Preliminary Remediation Goals, August 1.

[4] California Code of Regulations, Title 22, Section 66216.24.

items, which are the focus of the work described herein, include additional evaluation of: historical features, potential leachability of petroleum hydrocarbons, and groundwater quality at various site locations.

4.0 SAMPLING AND CHEMICAL ANALYSIS PROGRAM

Ten borings were advanced in the vicinity of historical site features and areas identified by the RWQCB (Figure 2) to collect soil and grab groundwater samples for chemical analysis. A description of the field and chemical analysis programs is presented below.

Prior to initiating the field effort, a drilling permit was obtained from the Sonoma County Department of Health Services (Appendix A). Underground utilities were identified by notifying Underground Service Alert, a regional subsurface notification center 48 hours prior to the start of field work and by contracting a private utility locator, Cruz Brothers Subsurface Locators, Inc., of Milpitas, California, to perform a utility clearance in the vicinity of the proposed boring locations.

4.1 FIELD METHODS

Geomatrix retained Precision Sampling, Inc. (Precision) of Richmond, California, a state-licensed drilling contractor to advance ten borings (SRB32[5] through SRB41) at the site on March 6 and 7, 2000. Based on field observations made at boring SRB39, borings SRB40 and SRB41 were added to the approved work plan to better characterize water quality near the former oil trap located along the western boundary of the property.

Borings were advanced to a maximum depth of 25 feet bgs using a XD-3, direct-push (DP) technology drill rig and the EnviroCore continuous sampling system. A continuous soil core was collected using a three-foot long continuous core barrel lined with clean stainless steel liners. Recovered soil was described and logged by a Geomatrix geologist using the American Society Testing and Material (ASTM) Standard D2488-90 and Munsell color designations (lithologic logs are included as Appendix B), and samples were collected for chemical analyses.

[5] A soil sample could not be recovered in the target sampling location of 4 to 4.5 feet bgs in boring SRB32 (see boring log in Appendix B). For this reason, boring SRB32A was drilled within approximately 2 feet to replace SRB32. Analytical results in tables are designated as from SRB32.

Drilling and sampling equipment was steam cleaned or triple washed with Alconox and distilled water before use at each boring location. During the drilling operation, an organic vapor monitor equipped with a photoionization detector (PID) was used as a screening instrument to evaluate the presence of volatile constituents in the recovered soil samples.

At each boring location where grab groundwater was proposed, a temporary well point was constructed of 1-inch-diameter, schedule 40 polyvinyl chloride (PVC) blank casing and 5 feet of 0.01-inch-slot schedule 40 PVC well screen. After the well point was placed within the borehole, Precision retracted up to five feet of Enviro-core drive casing to expose only the well screen to the water bearing zone. The depths at which grab groundwater samples were collected are shown on the boring logs presented in Appendix B. Following collection of soil and grab groundwater samples, borings SRB32 through SRB41 were grouted from total depth to ground surface with a Type I-II neat cement grout placed through a tremie pipe. The investigation-derived waste, equipment wash water and soil cuttings, generated during the field effort were placed in drums, labeled and stored on site within a locked enclosure pending analysis.

4.1.1 Soil Sampling

The sampling work plan prepared by Geomatrix initially proposed collecting soil samples at six locations at approximate depths of 1, 4, 7, and 9 feet below ground surface (bgs) and just above the water table, which was anticipated to occur at 10 to 12 feet bgs. Soil sample depths were slightly modified to 1, 4.5, 7.5, and 10.5 feet bgs. Soil samples were collected in 2-inch by 6-inch stainless steel liners sealed at each end with Teflon sheets and closed with plastic end caps and duct tape. All samples were placed in plastic ziploc bags and stored in an ice-chilled cooler for transport to the analytical laboratory under Geomatrix chain-of-custody procedures.

Additional soil samples were collected for further analysis of the presence of chromium on May 9, 2000. Four 5-foot borings (SRB33-A, SRB33-B, SRB34-A, and SRB34-B) were hand-augered within approximately 1 foot to the north and south of borings SRB33 and SRB34. Samples were collected at 1-foot intervals, placed in glass jars, and stored and transported as described above.

4.1.2 Grab Groundwater Samples

Geomatrix initially proposed to collect grab groundwater samples through temporarily installed well points from borings SRB34 through SRB39 (Figure 2). Based on field observations, SRB32, SRB40, and SRB41 were designated as additional grab groundwater sample locations.

Grab groundwater samples were obtained from temporary well points installed within the borings using a disposable bailer and bottom-emptying device with a stopcock to decant groundwater into laboratory-supplied 40-milliliter volatile organic analysis (VOA) vials preserved with hydrochloric acid and a peristaltic pump to extract groundwater into laboratory-supplied 1-liter amber bottles. Grab groundwater samples were labeled, placed in plastic bags, and stored in an ice-chilled cooler for transport to the analytical laboratory under Geomatrix chain-of-custody procedures.

4.2 ANALYTICAL METHODS

Soil and grab groundwater samples were submitted to Entech Analytical Labs, Inc., of Sunnyvale, California, a state-certified analytical laboratory, under Geomatrix chain-of-custody procedures. A copy of the laboratory analytical results and the chain-of-custody record is included in Appendix C.

Selected soil samples were analyzed for the following constituents:

- TPHd and TPHm by modified Environmental Protection Agency (EPA) Method 8015M: TPHd and TPHm analysis was performed following a silica gel cleanup procedures EPA Method 3630C;
- PNAs by EPA Method 8270 SIM;
- CAM 17 metals (antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, selenium, silver, thallium, vanadium, and zinc) by EPA Method 6000/7000 series; and
- waste extraction testing (WET) for simulated rainwater adjusted to a pH representative of local rainwater (rainwater WET).[6]

Grab groundwater samples collected were analyzed for the following constituents:

- TPHd and TPHm by modified EPA Method 8015M; TPHd and TPHm analysis was performed following a silica gel cleanup procedures (EPA Method 3630C);
- VOCs, including, methyl tertiary butyl ether (MTBE), and fuel oxygenates, by EPA Method 8260; and
- polynuclear aromatic compounds (PNAs) by EPA Method 8270 SIM.

[6] According to the California Department of Water Resources, the pH of rainwater in the Santa Rosa area is 5.5 (May 18, 19999 telephone conversation).

Grab groundwater samples for TPHd, TPHm, and PNA analysis were analyzed both with and without filtration using a 0.7 micron glass fiber filter. The purpose of the filtration was to minimize potential interferences associated with non-dissolved petroleum adhered to sediment entrained in groundwater (Foote, Zemo, and Gallardo, 1997; see Appendix D).

As described in the approved work plan, a sequential sampling methodology was implemented. Geomatrix requested analysis of shallow soil samples (collected at 1.0 and 4.5 feet bgs) from each boring. Soil samples collected from greater than 4.5 feet bgs and the bottom of each boring generally were held by the laboratory pending analytical results for the shallow soil samples submitted for analysis. At boring location SRB40, apparent odor was encountered between 4 and 13 feet bgs by Geomatrix field personnel; based on this field observation, the soil samples collected from 7.5 and 14.0 feet bgs were analyzed for TPHd, TPHm, and PNAs.

The need for additional analysis of deeper samples was implemented as follows:

- TPHd and TPHm: the next deeper sample was analyzed upon detection of TPHd or TPHm in a sample at concentrations of 50 milligrams per kilogram (mg/kg) or greater;
- PNAs: analysis of the next deeper sample was performed on a location by location basis, depending on the magnitude of the detected concentrations relative to PRGs and whether the detected PNAs decreased in concentration with depth; and
- Metals: analytical results were compared to ten times the Soluble Threshold Limit Concentration[7] (STLC) and the relative concentrations found in site soil; the deeper samples at those locations that exceeded these criteria were analyzed, except in boring SRB33, where soil was not recovered in the boring below 5 feet bgs (see lithologic log in Appendix B).

As described in the approved work plan, soil samples with the highest concentrations of TPH and PNAs were selected for leachability testing using a WET. WET testing for TPH was performed on the sample collected at 1-foot bgs from boring SRB36 and the sample collected at 7.5 feet bgs from boring SRB40. WET testing for PNAs was performed on the 1-foot samples collected from SRB32 and SRB40.[8]

[7] California Code of Regulations (CCR) Title 22 Section 66261.24

[8] In general, samples with higher PNA or TPH concentrations were selected for leachability testing. However, due to laboratory error, the 1-foot sample collected from boring SRB40 could not be analyzed for WET testing.

5.0 SITE STRATIGRAPHY

Observations during drilling of borings SRB32 through SRB41 are generally consistent with previous observations. The site is generally underlain by fill and/or aggregate baserock consisting of poorly graded sand with silt and gravel from the ground surface to approximately 1 to 4 feet bgs. The fill is underlain by interbedded fine-grained sediments [clay to sandy clay (CL)] to depths ranging between 4 and 20 feet bgs. A clayey sand unit was encountered in most borings at depths ranging between 7 and 18 feet bgs. The thickness of this unit ranged between 6 feet in the southeastern portion of the site to approximately 1 foot in the western portion of the site. Borings SRB36, SRB37, and SRB40 encountered a dark grayish brown clayey sand with gravel (SC) unit from about 19 feet bgs to the bottom of each boring (21 to 25 feet bgs). These observations are consistent with the documented lithology from previous borings SRB20, SRB21, and SRB22. Complete lithologic descriptions of subsurface materials encountered during the 1996 and recent investigations are presented in the boring logs in Appendix B.

Groundwater was encountered at depths between 7 and 14 feet bgs in all the borings except SRB37 and SRB40, which encountered water at 18 feet and 20 feet bgs, respectively.

6.0 LABORATORY ANALYTICAL RESULTS

Soil analytical results are summarized in Tables 1, 2, and 3. Groundwater analytical results are summarized on Table 4. Analytical laboratory data reports are included in Appendix C.

The analytical results for soil samples were compared to the Total Threshold Limit Concentration[1] (TTLC) and STLC; both criteria are used for establishing hazardous waste concentrations for disposal purposes. For this comparison, the total concentration of an individual metal was compared to 10 times its STLC.

The results also were compared to PRGs developed by the U.S. EPA Region 9 (U.S. EPA, 1999). PRGs represent the concentration of chemicals in soil associated with a target acceptable cancer risk level of $1x10^{-6}$ or a target non-cancer hazard index of 1.0. They are based on standard U.S. EPA estimates of exposure and toxicity. PRGs for soil are calculated based on both a residential land use and an industrial land use, and consider potential exposure to soil via ingestion, dermal contact and inhalation. Because current and foreseeable future use of the property is for commercial or industrial purposes, the industrial PRGs were used in this

evaluation. Analytical results for groundwater samples were compared to maximum contaminant levels (MCLs; Marshack, 1998), if established.

6.1 SOIL

6.1.1 Petroleum Hydrocarbons

Soil sample results for TPH analyses are presented on Table 1. TPHd was detected at five of the eight soil borings (SRB32, SRB33, SRB34, SRB36, and SRB40) at concentrations varying from 2.1 to 990 mg/kg. Detections of TPHd decreased with depth and were limited to shallow soils (less than 4.5 feet bgs) with one exception. At boring SRB40, TPHd was detected at elevated concentrations in the samples collected from 1.0 feet bgs (at 990 mg/kg) to 7.5 feet bgs (at 210 mg/kg); TPHd was not detected above laboratory report limits in the sample collected at 14.0 feet bgs.

TPHm was detected at four locations (borings SRB36, SRB39, SRB40, and SRB41) at concentrations varying from 40 to 1700 mg/kg. Detections of TPHm decreased with depth and were limited to shallow soils (less than 1.0 feet bgs) in borings SRB36 and SRB40. At boring SRB39, TPHm was detected at 720 mg/kg in the 1.0 foot sample; this elevated concentration was limited to shallow soil as demonstrated by the lower detections of TPHm at 51 and 49 mg/kg in the samples collected from 4.5 and 7.5 feet bgs, respectively. At boring SRB40, TPHm was detected at elevated concentrations in the samples collected from 1.0 feet bgs (at 1700 mg/kg) to 7.5 feet bgs (at 370 mg/kg); TPHm was not detected above laboratory report limits in the sample collected from this location at 14.0 feet bgs.

6.1.2 Polynuclear Aromatic Compounds

Results for PNA analysis of soil samples are presented in Table 2.

PNAs were detected at two locations (SRB32 and SRB33) in the sample collected from 1-foot bgs; PNAs were not detected above laboratory reporting limits (0.01 mg/kg) in the 4.5 foot bgs samples at both locations. At boring SRB32, PNAs were detected at concentrations varying from 0.073 mg/kg [dibenzo(a,h)anthracene] to 1.98 mg/kg (phenanthrene). In this sample, benzo(a)pyrene was present at a concentration of 0.526 mg/kg, which exceeds its industrial PRG of 0.29; however, the 95 percent upper confidence limit of the arithmetic mean (95% UCL), a value typically used as the representative concentration for risk assessment purposes, is 0.20 mg/kg, which is below the PRG. At boring SRB33, PNAs were detected at concentrations varying from 0.01 [benzo(g,h,i)perylene] to 0.028 (pyrene) mg/kg. PNAs were not detected above laboratory reporting limits in soil at any of the other six locations analyzed.

It should be noted that at three locations (SRB36, SRB39, and SRB40), the laboratory reporting limits were elevated in the samples collected at 1-foot bgs due to matrix interference;[9] however, standard laboratory reporting limits were achieved in the deeper samples analyzed at these locations.

6.1.3 Metals

Results for metals analysis of soil samples are presented in Table 3.

Metals were not detected above ten times the STLC with the exception of lead. Lead was detected at concentrations of 57 and 110 mg/kg in the sample collected from 1 foot bgs in borings SRB32 and SRB40, respectively. Lead was not detected above laboratory reporting limits in the next deeper sample at 4 feet bgs in boring SRB32; lead was detected at 7.4 mg/kg in the 4 feet bgs sample in boring SRB40.

Concentrations of arsenic detected in samples collected from borings SRB40 and SRB41 appeared elevated based on the relative concentrations of the samples collected across the site; however, these elevated concentrations were below ten times the STLC. Arsenic was detected at concentrations varying between 11 to 27 mg/kg; these concentrations are within the background range (9.3 to 31 mg/kg) found in Bay Area soils (LBNL, 1995). The upper tolerance limit (UTL) for arsenic at the site (16.2 mg/kg) is also below the UTL for the background data (LBNL, 1995), further indicating the results are consistent with background.

Chromium was also detected in borings SRB33 and SRB34 at concentrations that appeared elevated relative to other on-site detections. In these borings, chromium was detected at concentrations up to 630 mg/kg. In boring SRB34, the concentration of chromium decreased to 68 mg/kg (consistent with other on-site detections) in the sample collected at 7.5 feet bgs. No soil samples were collected below 4.5 feet bgs in boring SRB33. Chromium was not detected at concentrations exceeding ten times its STLC.

To further evaluate the concentrations and speciation of chromium at the site, additional samples near SRB33 and SRB34 were collected (SRB33-A, SRB33-B, SRB34-A, and SRB34-A). The results for total chromium in these samples, which were collected within 1 foot of the previous boring locations, are consistent with the concentrations of total chromium

[9] Matrix interference refers to "background" components in the sample that raise the baseline detection limit that could otherwise be achieved if the interfering components were not present. Such components could be natural, such as organic carbon, or introduced, such as petroleum.

detected across the site; the higher concentrations at SRB33 and SRB34 were not replicated (Table 3). Additionally, chromium (VI) was not detected in the additional samples.

The detected metals were also compared to current industrial PRGs. Each of the metals was either below its respective PRG (based on noncarcinogenic effects) or, as in the case of arsenic within expected background concentrations (Table 3).

6.2 RAINWATER WET

As indicated on Table 1, TPHd and TPHm were not detected above laboratory reporting limits in the rainwater WET tests for the samples collected at 1 foot bgs in boring SRB36 and at 7.5 foot bgs in boring SRB40. PNAs also were not detected above laboratory reporting limits in the rainwater WET tests for the samples collected at 1 foot bgs in boring SRB32 and at 7.5 foot bgs in boring SRB40 (Table 2).[10]

6.3 GROUNDWATER

Results for grab groundwater sampling are presented in Table 4.

TPHd was detected in two borings at 160 and 67 micrograms per liter (µg/l) in borings SRB34 and SRB36, respectively. TPHd was not detected above the laboratory reporting limit in the blind duplicate sample collected from boring SRB36 (labeled as SRB46). TPHm was detected in one boring (SRB34) at a concentration of 420 µg/l.

TPHd and TPHm were not detected above the laboratory reporting limits in the same samples, which were filtered with a 0.7 micron glass fiber filter prior to analysis. These data indicate that the detection of TPHd and TPHm in the unfiltered grab groundwater samples collected from borings SRB34 and SRB36 were likely due to the presence of non-dissolved petroleum adhered to sediment in the samples.

MTBE was detected at a concentration of 9.8 :g/l in the grab groundwater sample collected from boring SRB39. MTBE was not detected above laboratory reporting limits in groundwater samples collected at any other location. It should be noted that the detection of MTBE is downgradient (based on a groundwater flow direction to the west-southwest) of the La Rose Hotel, located at 101 5th Street. This site was formerly the location of a service station. At this site, elevated concentrations of gasoline and diesel (up to 59,000 µg/l and 6.9 µg/l,

[10] The leachability tests for TPH and PNAs from samples SRB36 and SRB32, respectively, were performed one day beyond their hold times.

respectively) have been detected in groundwater, as well as benzene, toluene, ethylbenzene and xylenes.[11] It is likely that the detection of MTBE in groundwater beneath the site can be attributed to this former service station.

PNAs and other VOCs were not detected above the laboratory reporting limits in the grab groundwater samples.

7.0 DISCUSSION

Based on the soil and grab groundwater analytical results, Geomatrix has developed the following conclusions.

Analytical results of soil and grab groundwater samples collected in the vicinity of historical site features, including the former fuel oil tank removed in 1987, suggest that use of these structures have not significantly impacted the site. These results are consistent with previous data generated at the site (Geomatrix, 1997). Specifically, TPHd and TPHmo were detected in shallow soil and limited vertically in extent. The presence of petroleum hydrocarbons primarily in shallow soil suggests that incidental surface spillage likely occurred. The absence of the TPHd and TPHmo at depth is consistent with the absence of these constituents in leachate from the rainwater WET. Similarly, PNAs were detected in shallow soil (1-foot bgs) at two locations, but were not detected in the next deeper samples (4.5-feet bgs). The presence of PNAs are not wide-spread and are at concentrations below their respective industrial PRGs.

Of the metals analyzed, only lead was detected in two shallow samples at concentrations that exceeded ten times its STLC; however, lead was below this criterion in the deeper samples. Metals, where detected, are present at concentrations below their respective industrial PRGs; arsenic is within its expected background concentration.

Grab groundwater analytical results indicate that former site operations have had little to no impact to site groundwater at the locations sampled. The detections of TPHd and TPHm in the two samples likely were affected by the presence of non-dissolved petroleum adhered to sediment in the samples; the evidence of this interference is exhibited by the absence of TPHd in the duplicate sample collected from SRB36 and the absence of TPHd and TPHm in the samples filtered with the 0.7 :m glass fiber filter. Although petroleum hydrocarbons reportedly may have been detected in grab groundwater during the IC investigation, the grab groundwater

[11] Information was obtained from RWQCB files in 1994. At this time, the data in the files was current to 1990. The current status of the La Rose Hotel site is not known.

sample collected from SRB39 (immediately adjacent and downgradient of the IC boring B-6) did not contain TPHd, TPHm, or PNAs above laboratory reporting limits. The presence of MTBE likely is not related to the former fuel oil tank and was not detected at other on-site locations. Based on its low concentration, MTBE has not significantly impacted groundwater beneath the site.

8.0 CONCLUSIONS AND RECOMMENDATIONS

The results of this recent investigation are consistent with the results of previous investigative activities at the site. In general, these results indicate the presence of residual constituents primarily in shallow soil, and no significant impact to groundwater as a result of previous railroad operations. These constituents do not pose a health risk given a future commercial/industrial site use. Additionally, leachability testing indicates that petroleum hydrocarbons and PNAs do not present a long-term risk to groundwater. Given the data presented herein, we recommend no further action and request that regulatory closure be granted.

Notes:

1. Samples collected by Geomatrix Consultants, Inc. on November 14 and 15, 1996 and March 6 and 7, 2000. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California. Samples collected in 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California for TPHd and TPHm using EPA Method 8015M following silica gel cleanup procedure per method 3630C.
2. Depth measured in feet below ground surface.
3. Waste extraction test was performed using simulated rainwater; results are reported in micrograms per liter.
4. "c" denotes composite sample.
5. -- = not analyzed.
6. Lab sheet indicates that result is quantified as diesel; chromatographic pattern not typical of fuel.

Abbreviations:

TPHd = total petroleum hydrocarbons quantified as diesel
TPHm = total petroleum hydrocarbons quantified as motor oil
WET = waste extraction test

Notes:

1. Samples collected by Geomatrix Consultants, Inc. on November 14 and 15, 1996 and March 6 and 7, 2000. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California using EPA Method 8310. Samples collected in 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California using EPA Method 8270SIM.
2. Depth measured in feet below ground surface.
3. Waste extraction test performed using simulated rainwater; results are reported in micrograms per liter (µg/l).
4. "c" denotes composite sample.
5. -- = not analyzed.
6. Industrial Preliminary Remediation Goals from U.S. EPA Region 9 (U.S. EPA 1999).
7. PRGs were not available for these constituents. Surrogate PRGs for a constituent with similar physical and chemical properties were used for the PRG comparison.

Abbreviations:
PNAs = polynuclear aromatic hydrocarbons
PRGs = preliminary remediation goals

Notes:

1. Samples collected by Geomatrix Consultants, Inc. on November 14 and 15, 1996 and March 6 and 7, 2000. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California. Samples collected in 2000 were analyzed by Entech Analytical, Inc., of Sunnyvale, California.
2. "c" denotes composite sample.
3. -- = Sample not analyzed for this metal.
4. Industrial Preliminary Remediation Goals (PRGs) from U.S. EPA Region 9 (U.S. EPA 1999).
5. The industrial PRG for arsenic at cancer risk levels of $1x10^{-6}$ to $1x10^{-4}$ ranges between 3.0 mg/kg and 300 mg/kg, respectively. At $1x10^{-6}$ cancer risk, the PRG is less than background and therefore is not applicable.
6. The industrial PRG for chromium (III) is used, as speciation of chromium in borings SRB 33-A, SRB 33-B, SRB-34A, and SRB 34-B did not indicate the presence of chromium (VI).
7. PRGs were not available for these constituents. Surrogate PRGs for a constituent with similar physical and chemical properties were used for the PRG comparison.
8. STLC = Soluble Threshold Limit Concentration, California Code of Regulations, Title 22, Section 66216.24
9. TTLC = Total Threshold Limit Concentration, California Code of Regulations, Title 22, Section 66216.24

Notes:

1. Samples collected by Geomatrix Consultants, Inc. on November 14 and 15, 1996 and March 6 and 7, 2000. Samples collected in 1996 were analyzed by American Environmental Network of Pleasant Hill, California; TPHd and TPHm were analyzed using EPA Method 8015 following silica gel cleanup procedure EPA Method 3630C and VOCs were analyzed for using EPA Method 8240. Samples analyzed by Entech Analytical, Inc. of Sunnyvale, California and analyzed for TPHd and TPHm using EPA Method 8015M following silica gel cleanup procedure per method 3630C; PNAs using EPA Method 8270SIM; and VOCs including MTBE and other fuel oxygenates using EPA Method 8260. Samples that were collected in 2000 for TPHd, TPHm, and PNAs were analyzed before and after passing through a 0.7 micron galss fiber filter.
2. Chloroform was detected in equipment blank sample at a concentration of 9.6 µg/l.
3. Lab sheet indicates that result is quantified as diesel; chromatographic pattern not typical of fuel.
4. Results of sample/blink duplicate sample (labeled SRB46) are shown.

Abbreviations:

TPHd = total petroleum hydrocarbons quantified as diesel
TPHm = total petroleum hydrocarbons quantified as motor oil
f = filtered with 0.7 micron glass fiber filter
PNAs = polynuclear aromatic hydrocarbons
MTBE = methyl tertiary butyl ether
VOCs = volatile organic compounds
ND = not detected above laboratory reporting limits (for VOCs: 5 to 100 µg/l).

WORKERS COMPENSATION CERTIFICATE

I hereby agree to comply with all laws and regulations of the County of Sonoma and State of California pertaining to water well construction. I will telephone (707) 525-6565, 24 hours in advance, to notify the Environmental Health Specialist when completing or destroying a well. I will furnish the Director of Health Services and the owner a legible copy of the State Water Well Driller's Report within 15 days in order to obtain final approval on this well. I acknowledge that the application will become a permit *only* after site approval and payment of fee. I understand that this permit is not transferable and expires one year from date of issuance.

[X] A currently effective certificate of Workers Compensation Insurance coverage is on file with this office, ***made out in the name of the Sonoma County Department of Health Services.***

Signature of Well Driller—*no proxies* _____ Date FEB 18, 2000

Insurance Carrier STATE FUND Expiration Date 2/1/01

Once all wells/borings are installed, submit a "Letter of Completion" to complete permit process.

Indicate on attached plot plan the exact location of well(s) with respect to the following items: property lines, water bodies or water courses drainage pattern, roads, existing wells, sewer main and laterals and private sewage disposal systems or other sources of contamination or pollution. INCLUDE DIMENSIONS. The validity of this permit depends upon the accuracy of the information provided by the applicant.

DESCRIPTION
NAME (USCS): color, moist, % by wt., plast. density, structure, cementation, react. w/HCl, geo. inter.

Surface Elevation: Not surveyed

POORLY GRADED SAND with SILT and GRAVEL (SP-SM): very dark grayish brown (10YR 3/2), moist, 50% fine to coarse sand, 40% fine to coarse gravel, 10% nonplastic fines

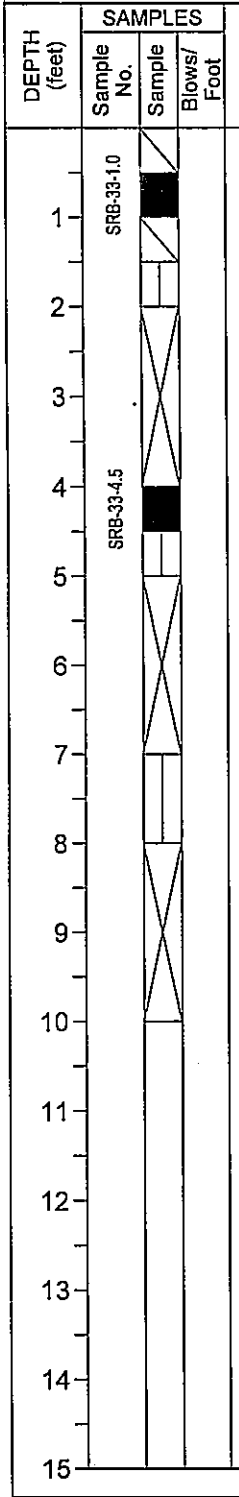
LEAN CLAY (CL): black (5Y 2.5/1), moist, 90% fines, 10% fine sand, trace coarse sand, medium plasticity, hard

LEAN CLAY with SAND (CL): dark brown (10YR 3/3), moist, 80% fines, 20% fine sand, trace coarse sand, medium plasticity, hard

SANDY LEAN CLAY (CL): brown (10YR 4/3), moist, 65% fines, 35% fine to medium sand, trace coarse sand, low plasticity, firm

CLAYEY SAND (SC): dark brown (10YR 3/3), wet, 75% fine to coarse sand, 25% low plasticity fines

Bottom of boring at 13.0 feet



REMARKS

OVM = Thermo Environmental Instruments 580 PID calibrated with 100 ppm isobutylene standard.

Grab groundwater sample SRB-32a collected through 5 ft. of 1-inch diameter Sch. 40 PVC screen (0.020-inch slot size) placed in borehole from 8 to 13 ft. bgs. Enviro-core drive casing retracted from bottom of boring to 10 ft. bgs to maintain surface seal.

Borehole destroyed with Type I-II neat cement grout placed from total depth to ground surface with a tremie pipe.

March 15, 2000

Penny Tse
Geomatrix Consultants
2101 Webster Street, 12th Floor
Oakland, CA 94612

Order:	19381	**Date Collected:**	3/6/00
Project Name:	Santa Rosa	**Date Received:**	3/6/00
Project Number:	2770.005	**P.O. Number:**	Invoice UP directly
Project Notes:			

On March 06, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Liquid	EPA 8260B	EPA 8260B
	EPA 8270 PAH SIMS-ATL	EPA 8270
	TPH as Diesel w/ Si-Gel Column	EPA 8015 MOD. (Extractable)
	TPH as Diesel w/ Si-Gel Column + Filter	EPA 8015 MOD. (Extractable)
	TPH as Motor Oil w/ Si-Gel Column	EPA 8015 MOD. (Extractable)
	TPH as Motor Oil w/ Si-Gel Column + Filter	EPA 8015 MOD. (Extractable)

Case Narrative: Due to the limitation of LIMS software, the Hexacosane surrogate recovery limits reported reflect normal TPH-extractrables surrogate limits rather than silica gel cleanup limits. The correct surrogate control limits for silica gel cleanup are 53-119 rather than 65-135

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

Michelle L. Anderson, Laboratory Director

March 10, 2000 ELAP No.: 1838

Entech Analytical Labs, Inc.
525 Del Rey Avenue, Suite E,
Sunnyvale, CA 94086

ATTN: Michelle Anderson

Client's Project: Geomatrix Consultants
Lab No.: 42289-001/003

Enclosed are the results for sample(s) received by Advanced Technology Laboratories and tested for the parameters indicated in the enclosed chain of custody.

Thank you for the opportunity to service the needs of your company. Please feel free to call me at (562) 989 - 4045 if I can be of further assistance to your company.

Sincerely,

Cheryl De Los Reyes
Technical Operations Manager
CDR/jh

Enclosures

This cover letter is an integral part of this analytical report.

This report pertains only to the samples investigated and does not necessarily apply to other apparently identical or similar materials. This report is submitted for the exclusive use of the client to whom it is addressed. Any reproduction of this report or use of this Laboratory's name for advertising or publicity purpose without authorization is prohibited.

Order:	19426	**Date Collected:**	3/7/00
Project Name:	Santa Rosa	**Date Received:**	3/8/00
Project Number:	2770.005	**P.O. Number:**	Invoice UP
Project Notes:			

On March 08, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	EPA 8270 SIM-ATL	EPA 8270

Case Narrative: Due to the limitations of LIMS software, the Hexacosane recovery limits reported reflect normal TPH-Extractable surrogate limits rather than silica gel column cleanup limits. The correct surrogate control limits for silica gel column cleanup are 53-119 rather than 65-135

For EPA 8270 PAH SIMS analysis on sample 19426-003 (SRB-40-7.5), a rainwater STLC (DI water buffered to pH 5.5) was performed on 3/20/00 at Entech Analytical Laboratories. After filteration, the extract was submitted to ATL (ELAP#1868) on 3/24/00 for EPA 8270-PAH SIMS analysis. The analytical results and all associated QC is included in the following report.

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Order:	19426	**Date Collected:**	3/7/00
Project Name:	Santa Rosa	**Date Received:**	3/8/00
Project Number:	2770.005	**P.O. Number:**	Invoice UP
Project Notes:			

On March 08, 2000, sample was received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	EPA 8270 PAH SIMS-ATL	EPA 8270
	EPA 8270 SIM-ATL	EPA 8270
	TPH as Diesel w/ Si-Gel C/U (Column)	EPA 8015 MOD. (Extractable)
	TPH as Motor Oil w/ Si-Gel Column	EPA 8015 MOD. (Extractable)

Case Narrative: Due to the limitations of LIMS software, the Hexacosane recovery limits reported reflect normal TPH-Extractable surrogate limits rather than silica gel column cleanup limits. The correct surrogate control limits for silica gel column cleanup are 53-119 rather than 65-135

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

STANDARD LAB QUALIFIERS (FLAGS)

All Entech lab reports now reference standard lab qualifiers. These qualifiers are noted in the adjacent column to the analytical result and are adapted from the U.S. EPA CLP program. The current qualifier list is as follows:

Qualifier (Flag)	Description
U	Compound was analyzed for but not detected
J	Estimated value for tentatively identified compounds or if result is below PQL but above MDL
N	Presumptive evidence of a compound (for Tentatively Identified Compounds)
B	Analyte is found in the associated Method Blank
E	Compounds whose concentrations exceed the upper level of the calibration range
D	Multiple dilutions reported for analysis; discrepancies between analytes may be due to dilution
X	Results within quantitation range; chromatographic pattern not typical of fuel

REVISED

Allan,

Attached are amended COCs for the following analysis:

COC#3764 – Sample SRB32-1.0 (19411-001) for for modified leachability testing for simulated rainwater [using deionized water adjusted to pH 5.5] (Rainwater WET) for PNAs

Sample SRB36-1.0 (19411-002) for Rainwater WET for TPHm

Sample SRB36-7.5 (19411-011) for Nickel (6010)

Sample SRB35-7.0 (19411-017) for Nickel (6010)

COC # 3758 - Sample SRB34-7.5 (19411-018) for Chromium and Nickel (6010)

COC #3763 - Sample SRB40-1.0(19426-001) for Rainwater WET for TPHm and PNAs

Sample SRB40-7.5(19426-003) for PNAs (8270SIM) & arsenic, chromium, and nickel (6010)

Sample SRB40-14.0(19426-005) for PNAs (8270SIM)

Sample SRB41-7.5 (19426-010) for ~~chromium~~ arsenic and nickel (6010)

Please contact me if you have any questions pertaining to the Rainwater WET test procedures.

Order:	19426	**Date Collected:**	3/7/00
Project Name:	Santa Rosa	**Date Received:**	3/8/00
Project Number:	2770.005	**P.O. Number:**	Invoice UP
Project Notes:			

On March 08, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	Arsenic	EPA 6010B

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

Order:	19427	**Date Collected:**	3/7/00
Project Name:	Santa Rosa	**Date Received:**	3/8/00
Project Number:	2770.005	**P.O. Number:**	
Project Notes:			

On March 08, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Liquid	EPA 8260B	EPA 8260B
	EPA 8270 PAH SIMS-ATL	EPA 8270
	TPH as Diesel w/ Si-Gel Column	EPA 8015 MOD. (Extractable)
	TPH as Diesel w/ Si-Gel Column + Filter	EPA 8015 MOD. (Extractable)
	TPH as Motor Oil w/ Si-Gel Column	EPA 8015 MOD. (Extractable)
	TPH as Motor Oil w/ Si-Gel Column + Filter	EPA 8015 MOD. (Extractable)

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

ATTN: Michelle Anderson

Client's Project: Geomatrix Consultants
Lab No.: 42399-001/002

Enclosed are the results for sample(s) received by Advanced Technology Laboratories and tested for the parameters indicated in the enclosed chain of custody.

Thank you for the opportunity to service the needs of your company. Please feel free to call me at (562) 989 - 4045 if I can be of further assistance to your company.

Sincerely,

Cheryl De Los Reyes
Technical Operations Manager
CDR/jh

ANALYSES

REMARKS

Additional Comments

- Please Bill Union Pacific directly - Contact: John Moe Contract No.: 707311
- 5 day Turnaround - Firm
May require additional analysis

* Include MTBE and fuel Oxygenates for EPA 8260

① Please use a 0.7 micron glass filter on 1 of each 3 samples taken for PNAs (8270 SIM) and for TPH-d/TPH-mo (8015M)

Clarification: Perform filtered + unfiltered analysis for TPH + PNAs

Laboratory: Entech

Turnaround Time: 5 day - Firm

Results to: Penny Tse

Total No. of Containers: 18

Order: 19409
Project Name: Santa Rosa
Project Number: 2770.005
Project Notes:

Date Collected: 3/6/00
Date Received: 3/7/00
P.O. Number: Invoice Union Pacific

On March 07, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Liquid	EPA 8260B	EPA 8260B

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

Oakland, CA 94612

Order:	19409	**Date Collected:**	3/6/00
Project Name:	Santa Rosa	**Date Received:**	3/7/00
Project Number:	2770.005	**P.O. Number:**	Invoice Union Pacific
Project Notes:			

On March 07, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Liquid	EPA 8260B	EPA 8260B
	EPA 8270 PAH SIMS-ATL	EPA 8270
	TPH as Diesel w/ Si-Gel Column	EPA 8015 MOD. (Extractable)
	TPH as Diesel w/ Si-Gel Column + Filter	EPA 8015 MOD. (Extractable)
	TPH as Motor Oil w/ Si-Gel Column	EPA 8015 MOD. (Extractable)
	TPH as Motor Oil w/ Si-Gel Column + Filter	EPA 8015 MOD. (Extractable)

Case Narrative: Due to the limitation of LIMS software, the Hexacosane surrogate recovery limits reported reflect normal TPH-extractrables surrogate limits rather than silica gel cleanup limits. The correct surrogate control limits for silica gel cleanup are 53-119 rather than 65-135

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Order:	19411	**Date Collected:**	3/6/00
Project Name:	Santa Rosa	**Date Received:**	3/7/00
Project Number:	2770.005	**P.O. Number:**	Invoice Union Pacific
Project Notes:			

On March 07, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	Chromium	EPA 6010B
	Nickel	EPA 6010B
	TPH as Diesel, STLC Rainwater	EPA 8015 MOD. (Extractable)
	TPH as Motor Oil, STLC Rainwater	EPA 8015 MOD. (Extractable)

Case Narrative: Due to the limitation of LIMS software, the Hexacosane surrogate recovery limits reported reflect normal TPH-extractrables surrogate limits rather than silica gel cleanup limits. The correct surrogate control limits for silica gel cleanup are 53-119 rather than 65-135

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

Order: 19411
Project Name: Santa Rosa
Project Number: 2770.005
Project Notes:

Date Collected: 3/6/00
Date Received: 3/7/00
P.O. Number: Invoice Union Pacific

On March 07, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	CAM 17 TTLC	EPA 6010B
		EPA 7471
	EPA 8270 SIM-ATL	EPA 8270
	TPH as Diesel w/ Si-Gel C/U (Column)	EPA 8015 MOD. (Extractable)
	TPH as Gasoline	EPA 8015 MOD. (Purgeable)
	TPH as Motor Oil w/ Si-Gel Column	EPA 8015 MOD. (Extractable)

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

STANDARD LAB QUALIFIERS (FLAGS)

All Entech lab reports now reference standard lab qualifiers. These qualifiers are noted in the adjacent column to the analytical result and are adapted from the U.S. EPA CLP program. The current qualifier list is as follows:

Qualifier (Flag)	Description
U	Compound was analyzed for but not detected
J	Estimated value for tentatively identified compounds or if result is below PQL but above MDL
N	Presumptive evidence of a compound (for Tentatively Identified Compounds)
B	Analyte is found in the associated Method Blank
E	Compounds whose concentrations exceed the upper level of the calibration range
D	Multiple dilutions reported for analysis; discrepancies between analytes may be due to dilution
X	Results within quantitation range; chromatographic pattern not typical of fuel

Order: 19411
Project Name: Santa Rosa
Project Number: 2770.005
Project Notes:

Date Collected: 3/6/00
Date Received: 3/7/00
P.O. Number: Invoice Union Pacific

On March 07, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	EPA 8270 PAH SIMS-ATL	EPA 8270

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

Client's Project: Geomatrix Consultants
Lab No.: 42398-001/019

Enclosed are the results for sample(s) received by Advanced Technology Laboratories and tested for the parameters indicated in the enclosed chain of custody.

Thank you for the opportunity to service the needs of your company. Please feel free to call me at (562) 989 - 4045 if I can be of further assistance to your company.

Sincerely,

Cheryl De Los Reyes
Technical Operations Manager

SUBJECT: **AMENDED REPORT**

Client's Project: Geomatrix Consultants
Lab No.: 42398-001/019

The report was amended for the following:

Sample I.D. for 42398-006 and 42398-008, were corrected.

Please disregard all previous documentation that corresponds to the pages(s) enclosed.

Sincerely,

Cheryl De Los Reyes
Technical Operations Manager

Order:	19382	**Date Collected:**	3/6/00
Project Name:	Santa Rosa	**Date Received:**	3/6/00
Project Number:	2770.005	**P.O. Number:**	Invoice UP directly
Project Notes:			

On March 06, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	TPH as Motor Oil w/ Si-Gel Std	EPA 8015 MOD. (Extractable)

Case Narrative: Due to the limitation of LIMS software, the Hexacosane surrogate recovery limits reported reflect normal TPH-extractrables surrogate limits rather than silica gel cleanup limits. The correct surrogate control limits for silica gel column cleanup are 53-119 rather than 65-135

Report was amended on 3/14/00 to correct PQL and DLR for CAM 17 results.

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

Entech Analytical Labs, Inc.
525 Del Rey Avenue, Suite E,
Sunnyvale, CA 94086

ATTN: Michelle Anderson

Client's Project: Geomatrix Consultants
Lab No.: 42290-001/005

Enclosed are the results for sample(s) received by Advanced Technology Laboratories and tested for the parameters indicated in the enclosed chain of custody.

Thank you for the opportunity to service the needs of your company. Please feel free to call me at (562) 989 - 4045 if I can be of further assistance to your company.

Sincerely,

Cheryl De Los Reyes
Technical Operations Manager
CDR/jh

Enclosures

This cover letter is an integral part of this analytical report.

This report pertains only to the samples investigated and does not necessarily apply to other apparently identical or similar materials. This report is submitted for the exclusive use of the client to whom it is addressed. Any reproduction of this report or use of this Laboratory's name for advertising or publicity purpose without authorization is prohibited.

Order:	20424	**Date Collected:**	5/9/00
Project Name:	Santa Rosa	**Date Received:**	5/10/00
Project Number:	2770.005	**P.O. Number:**	Invoice Union Pacific
Project Notes:			

On May 10, 2000, samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	Chromium	EPA 6010B
	Chromium (VI)	EPA 7196A

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

Well Abandonment Report

Union Pacific Railroad
2 Fourth Street and 34 Sixth Street, Santa Rosa, California
North Coast Regional Water Quality Control Board
Case No. 1TSR196

1.0 INTRODUCTION

Antea®Group (Antea Group) has prepared this Well Abandonment Report to document the abandonment of 4 (four) wells associated with the subject site. These wells were abandoned as requested in correspondence from the North Coast Regional Water Quality Control Board (NCRWQCB). A Site Location Map and Site Plan are provided as **Figure 1** and **Figure 2,** respectively. Agency correspondence granting closure concurrence and the directive to destroy site monitoring wells is provided as **Appendix A**. As case obligations are now complete, following agency review of this document, Antea Group requests to receive correspondence documenting final case closure.

2.0 WELL ABANDONMENT ACTIVITIES

All wells were destroyed by Gregg Drilling and Testing, Inc. (Gregg), C-57 License #485165, under the supervision of Antea Group. Antea Group obtained well abandonment permits from the Sonoma County Department of Environmental Health (**Appendix B**).

2.1 Well Abandonments

On February 10 and 11, 2015, Antea Group oversaw the proper abandonment of all 4 site-associated wells. Each well was drilled out to total depth and subsequently backfilled with neat cement grout until the level of grout within the well stabilized (until the grout level did not decrease). The well boxes were removed from all locations and the surface was finished to match the surrounding areas. Following well abandonment, Antea Group and Gregg completed Well Completion Report (WCR) forms for the Department of Water Resources (DWR). Copies of these forms have been sent Sonoma County Department of Environmental Health; the original WCR forms have been submitted to the DWR.

3.0 WASTE DISPOSAL

Soil cuttings and construction debris (concrete and well casing material) generated during well abandonment activities were placed in Department of Transportation (DOT) approved 55-gallon drums, sealed and labeled in accordance with the corresponding DOT protocols for non-hazardous waste and temporarily stored on site pending waste characterization. Soil drums and construction debris were subsequently removed from the site on March 19, 2015 and transported to an approved disposal facility. Copies of the non-hazardous waste manifests are provided as **Appendix C**

4.0 REMARKS

The recommendations contained in this document represent Antea USA, Inc.'s professional opinions based upon the currently available information and are arrived at in accordance with currently accepted professional standards. This document is based upon a specific scope of work requested by the client. For any reports cited that were not generated by Delta or Antea Group, the data from those reports is used "as is" and is assumed to be accurate. Antea Group does not guarantee the accuracy of this data for the referenced work performed nor the inferences or conclusions stated in these reports. The contract between Antea USA, Inc. and its client outlines the scope of work, and only those tasks specifically authorized by that contract or outlined in this document were performed. This document is intended only for the use of Antea USA, Inc.'s client and anyone else specifically identified in writing by Antea USA, Inc. as a user of this document. Antea USA, Inc. will not and cannot be liable for unauthorized reliance by any other third party. Other than as contained in this paragraph, Antea USA, Inc. makes no express or implied warranty as to the contents of this document.

Agency Correspondence

CALIFORNIA Water Boards

EDMUND G. BROWN JR. GOVERNOR

MATTHEW RODRIQUEZ SECRETARY FOR ENVIRONMENTAL PROTECTION

North Coast Regional Water Quality Control Board

January 9, 2015

Ms. Lauren A. Mancuso
Manager of Environmental Site Remediation
Union Pacific Railroad Company
9451 Atkinson Street, Suite 100
Roseville, CA 95747
lamancus@up.com

Dear Ms. Mancuso:

Subject: Concurrence with "Well Abandonment Work Plan"

Site: Southern Pacific Transportation Company, 20 West Third Street, Santa Rosa
Case No. 1TSR196 and 1NSR196

On December 16, 2014, the "Well Abandonment Work Plan" was received for the former Southern Pacific Transportation Company's rail yard located off West Third Street in Santa Rosa. We concur with the well abandonment work plan as written.

Please provide documentation on the well destruction and that all wastes have been removed from the site. Once that information is received, you will receive a letter indicating no further action is required.

If you have questions, please contact me at Janice.Goebel@waterboards.ca.gov or (707) 576-2676.

Sincerely,

Janice M. Goebel
Sanitary Engineering Associate

Submit plot plan of wells in relation to all sewer or septic lines.

Is well to be constructed within: 100 feet of a septic tank or leach field? ○Yes ◉No

50 feet of any sanitary sewer line? ◉Yes ○No

25 feet of any private sanitary sewer line? ○Yes ◉No

01/23/15

In addition, all monitoring wells must include an ***identification system*** affixed to the interior surface:

1) Well identification 2) Well type 3) Well depth 4) Well casing diameter 5) Perforated intervals

Well identification number and well type shall be ***affixed*** to the ***exterior surface*** security structure.

For Office Use Only

Address 34 6th St ; 2424th St.

Site ID# FA0041705

Permit # SRO12665

I hereby agree to comply with all laws and regulations of the County of Sonoma and State of California pertaining to water well construction. I will telephone (707) 565-6565, 48 hours in advance, to notify the Environmental Health Specialist when completing or destroying a well. I will furnish the Director of Environmental Health and the owner a legible copy of the State Water Well Driller's Report within 15 days; and a copy of the Summary Report, including sample results, should be received by the Department of Health Services, Environmental Health and Safety Section within 90 days in order to obtain final approval on this well permit. I acknowledge that the application will become a permit ***only*** after site approval and payment of fee. I understand that this permit is not transferable and expires one year from date of issuance.

Signature of Well Driller—***no proxies (Wet Signature Required)*** Date 11/5/15

Insurance Carrier AON Risk Insurance Services Expiration Date 8-1-2015

Once all wells/borings are installed, submit a Well Driller's Log and/or Summary Report to complete permit process.

Indicate on attached plot plan the exact location of well(s) with respect to the following items: property lines, water bodies or water courses drainage pattern, roads, existing wells, sewer main and laterals and private sewage disposal systems or other sources of contamination or pollution. INCLUDE DIMENSIONS. The validity of this permit depends upon the accuracy of the information provided by the applicant.
